Re: Solid Waste Permit, Part 1- Permit to Construct
Iredell County MSWLF Landfill - CDLF Expansion 2A
Permit Number 49-03

Dear Mr. Lambert:

Enclosed is Solid Waste Permit 49-03, Part 1 - Permit to Construct for CDLF expansion (800 x 100) and specific construction of Phase 2 of the CDLF. Also enclosed is an approved copy of the permit to construct application.

Please note the Facility and CDLF pre-operative conditions (Condition No.'s 13, 14 and 19) that must be met in order to obtain Solid Waste Permit, Part 2 - Permit to Operate.

Please contact me at (704) 235-2163, if you have any questions or comments.

Sincerely,

John E. Murray, P.E.
Regional Permitting Engineer

MEMORANDUM

APPROVED
DIVISION OF WASTE MANAGEMENT
SOLID WASTE SECTION
DATE 2-7-06 BY

To: John Murray

From: Brian Wootton

Subject: Application for Permit to Construct
Iredell County – C&D Landfill
Proposed Phase 2 Extension – 100 feet X 800 feet
Final Comments
Permit No. 49-03

I have reviewed the written request by Municipal Engineering Services, P.A. (December 16, 2005) on behalf of Iredell County to construct an additional 80,000 square feet to Phase 2. The hydrogeologic study was completed for Phase 2 and 3 on January 28, 2004. Vertical separation requirements between the seasonal high water table, rock, and bottom of waste are ample based on groundwater level data and statistical data from 2001 to 2005. **The Study and supporting information meets the criteria required in the Rules [(i.e. 15A NCAC 13B .0505(7)(a), and Solid Waste Section policy]; therefore, I have no objection to issuance of this portion to Permit to Construct based on this rule.**

Construction Conditions: (Include these conditions in the Permit to Construct)

The owner's geologist shall examine the cell excavation and note any pertinent geologic features exposed during the construction process and shall notify the Solid Waste Section Hydrogeologist of these findings prior to placement of any liner materials.

Surface water and ground-water monitoring requirements shall remain the same.

Please contact me with any questions or comments. I can be reached at (919) 508-8524 or by e-mail.

Sincerely,

Brian Wootton

Re: Iredell County C&D Landfill Phase 2 Extension - Permit # 49-03
MESCO Project No. G04100

Dear Mr. Wootton:

In response to your concerns that the excavation has altered the groundwater elevations post design study. It has just come to my attention that the design study for the phase 2 & 3 portions of the Iredell county C&D landfills was performed post excavation of the area. Excavation of the area as a borrow site was performed in 2001 and 2002. Piezometers installed for the Phase 2 & 3 study were installed in October and November 2001. Water levels used to calculate seasonal highs were collected from February 2002 until December 2003.

The site has been sampled four times since completion of the Design Study. As part of the ground water sampling groundwater levels were measured. Four of the design study piezometers were converted to monitoring wells (CD-3 to MW-22, CD-6 to MW-23, CD-8S to MW-24S, and CD-8D to MW-24D). Monitoring wells MW-24S and MW-24D are down gradient of the excavated area. Water levels fluctuations observed during the sampling events in monitoring wells MW-24S and MW-24D are in-line with the water level fluctuations observed from monitoring wells MW-9RR and MW-10R. Groundwater levels from the sampling events have not indicated a rise in water levels since the design study was completed. Groundwater levels, on average, from January 2004 through July 2005 have decreased in depth as compared to measured averages. Included is a summary of groundwater levels for wells used during sampling events and a general site map showing monitoring well locations.

If you have any questions or comments regarding this information, please contact me at (919) 772-5393 or by email at ecaldwell@mesco.com

Re:: Iredell County C&D Landfill Phase 2 Extension - Permit # 49-03
MESCO Project No. G04100

Dear Mr. Wootton:

Included is a brief summary of the approved Phase 2 & 3 Hydrogeologic Study for Iredell County C&D Landfill. The study was completed and on January 28, 2004. Phase 2 & 3 of the C&D landfill consists of approximately 17 acres. As part of the Phase 2 & 3 investigation Municipal Engineering Services (MESCO) installed ten piezometers to supplement the existing ten monitoring wells/piezometers from the Phase 1 portion.

Water levels for the Phase 2 & 3 investigation were collected from December 26, 2001 until December 17, 2003. The data collected was utilized to statistically predict long-term seasonal high water table elevations correlated to long-term seasonal high groundwater elevations from USGS wells. Plate 1, attached, depicts the calculated long term seasonal high potentiometric contours. Additionally on Plate 1, a cross section line along the proposed Phase 2 extension shows the calculated long term seasonal high, proposed sub-grade and existing grade-based on a February 2005 survey. Included are copies of pertinent plates from the Phase 2 & 3 Hydrogeologic Study. The first plate, Plate 4, shows cross section lines across Phase 2 & 3. The second plate, Plate 4A, depicts the cross sections showing soil lithologies, calculated long term seasonal high groundwater, proposed sub-grade, and proposed fill.

Boring logs were reviewed to determine top of competent rock. Competent rock was only encountered in boring CD-2, based on hollow stem auger refusal. Refusal occurred at 45 feet below ground surface (820.46 ft). Calculated long seasonal high for CD-2 is 835.13 ft., or 14.67 ft. above competent rock.

Phase 2 was build with a minimum vertical separation of 4 feet above calculated seasonal high groundwater in compliance with 15A NCAC 13B .0503 (d) (i). The Phase 2 extension and Phase 3 will also be built with a minimum 4 foot separation above the calculated long term seasonal high.

PO Box 97, Garner, North Carolina 27529 (919) 772-5393
PO Box 1197, Morehead City, NC 28557 (252) 726-9481
PO Box 349, Boone, North Carolina 28607 (828) 262-1767

Coinciding with the Phase 3 Engineering Permit, the Ground and Surface Water Sampling and Analysis Plan, as submitted in Appendix E of the Phase 2 & 3 Hydrogeologic Study, will be amended. The submitted sampling and analysis plan was submitted to adequately monitor all three phases of the C&D landfill. The plan falls to take into account the down gradient aspect of Phase 3, as such, the plan will be amended to address this concern.

If you have any questions or comments regarding this information, please contact me at (919) 772-5393 or by email at ecaldwell@mesco.com

NORTH CAROLINA GENERAL WARRANTY DEED

THIS DEED made August 7, 2000, by and between

GRANTOR	GRANTEE
Joy Acres Farm, Ltd., a North Carolina Limited Partnership	**Iredell County, a body politic and corporate and a political subdivision of the State of North Carolina** **P.O. Box 788** **Statesville, NC**

Enter in appropriate block for each party: name, address, and, if appropriate, character of entity, e.g., corporation or partnership.

The designation Grantor and Grantee as used herein shall include said parties, their heirs, successors, and assigns, and shall include singular, plural, masculine, feminine or neuter as required by context.

WITNESSETH, that the Grantor, for a valuable consideration paid by the Grantee, the receipt of which is hereby acknowledged, has and by these presents does grant, bargain, sell and convey unto the Grantee in fee simple, all that certain lot or parcel of land situated in the City of , Chambersburg Township, **Iredell** County, North Carolina and more particularly described as follows:

To locate the beginning point commence at an existing concrete monument which is situated in the Southeast corner of Accuma Corporation (Deed Book 1188,Page 1434) and run from said existing concrete monument N 05°36' 28" East 269.84 feet to a new iron pin corner subject property and Accuma Corporation(said iron pin is located N 76°45' 53" West 8.86 feet from the eastern edge of a sanitary sewer easement; and running from the beginning with the line of Accuma Corporation N 76°45' 53" West a total distance of 888.98 feet to an existing rebar (the N.C. Grid coordinates of which are N=7.37,558.65 and E=1,457,461.85) corner J.C. Steele & Sons, Inc. (Deed Book 574, Page 127); thence with Steele's line N 60° 26' 23" West 354.12feet to a new iron pin thence with another line of Steele N 04°36'27" West 710.00 feet to a new iron pin another corner of Steele thence with another line of Steele S 87°38' 55" West 470.0 feet to a new iron pin thence with another line of Steele S 05° 56' 55" West 1177.33 feet to a existing iron corner Ideal Basic Industries, (Deed Book 693, Page 732) thence with this line N 75° 57'12" West 730.64 feet to an existing rebar thence N 01°45'24" East 164.88 feet to an existing stone corner Iredell Development Company(Deed Book 1147, Page 1750) thence with its line N 03°16'09" East 450.50 feet to an existing iron thence N 88°39'07" West 187.41 feet to an existing iron pin thence N 00° 36' 03" East 96.87 feet to an existing rebar thence N 04°51'17" West 372.43 feet to an existing rebar thence N 47°21' 40" West 22.19 feet to an existing iron bolt thence N 01°37' 40" West 82.45 feet to an existing rebar corner of Iredell County(Deed Book 816, Page 155) thence with the line of Iredell County S 87°17' 53" East 2847.68 feet to a new iron pin in the line of a tract now or formerly owned by K.D. Haneline (Deed Book 939, Page 1822) thence S 04°51'51" West

Re: Permit Application
Iredell County C&D Phase 3
Permit No. 49-03

Mr. Wootton,

In response to you letter dated July 20, 2006, Municipal Engineering Services Co., P.A. (MESCO) has included the supplemental information to clarify and expedite the review process for the above referenced site.

Following are responses to your comments and questions:

Section Comment: *Section 2 Written Report – (i): Page 5*

Part (i) of the Written Report States the following "*A survey plat and deed for this property has been included in this section.*"

A copy of the survey plat and deed could not be located in the application or I overlooked it during review of the application. Please provide copie(s) or clarification.

Also, depict on this map or an additional map the acreage for the footprint for Phase 3.

Three (3) copies of the survey plat and deed are included herein. An additional map depicting the acreage of the footprint for Phase 3 is included (3 copies).

Section Comment: Section 3 – *Operation plan for Iredell County – 3 Page 12*

Page 12 of the Operational Plan mentions, in part, the frequency of surface and ground-water sampling.

Additional ground-water well(s) and surface water sampling point(s) may be required to monitor any potential impacts to surface water and groundwater from Phase 3 landfill operations. Submit a written discussion of possible revised Water Quality Plan (that includes Phase 3) explaining the reasoning and possible necessity of additional ground-water wells and surface water sampling points.

Also, provide the most current map, depicting the location of existing and proposed locations of ground-water sampling wells and surface water sampling points associated with this phase, and adjacent phases.

<u>If additional ground-water and surface sampling points are required, then installation of well(s) and sampling will be required before a Permit to Operate is issued.</u>

The drawing submitted with the application do not depict locations of borings, piezometers/wells inside the waste boundary of proposed Phase 3. Please clarify by stating whether or not previous existing wells, piezometer, and borings have been abandoned (sealed) correctly within the proposed footprint of Phase 3.

Attached are three (3) copies of the revised Ground and Surface Water Sampling Analysis Plan (SAP) for Iredell County C&D Phase 3. Included in the SAP are the addition of three (3) groundwater monitoring wells. It should be noted that the monitoring wells have already been installed. A map (Plate A) depicts the current sampling locations. Monitoring wells MW-25, MW-26S, and MW-26D are shown inside the buffer limits, but they are outside the proposed fill area as can be seen on Plate A.

Background groundwater samples of MW-25, MW-26S and MW-26D are scheduled to be collected on October 12, 2006. Piezometers which were located inside the Phase 3 waste boundary were abandoned with grout in compliance with 15A NCAC 2C Rule .0113(a)(2) during the Phase 2 construction with the exception of CD-7. Piezometer CD-7 was abandoned with grout on January 28, 2005. Well construction records and well abandonment records are provided in the appendix of the SAP.

If you have any questions please feel free to contact me at (919) 772-5393.

Sincerely,

MUNICIPAL ENGINEERING SERVICES CO., P.A.

Ethan J. Caldwell, PG

LIFE EXPECTANCY CALCULATIONS
IREDELL COUNTY C & D
LANDFILL PHASE 2 EXTENSION

APPROVED
NC DENR WASTE MANAGEMENT
SOLID WASTE SECTION
DATE 3-3-06 BY

Given:

Based on the survey data for July 2005 Iredell County averages approximately 107,404 yd^3 per year, therefore:

Life Expectancy Remaining = 208,000 cubic yards ÷ 107,404 cubic yards
In Phase 2 with the 100'
Extension of Phase 2 = 1.94 years

*Determined by AutoCADD computer program.

1 INTRODUCTION

1.1 Objective

The objective of the Ground and Surface Water Sampling and Analysis Plan is to provide clear guidelines and procedures to be followed by field and laboratory personnel when obtaining and testing ground and surface water samples. This plan is developed for the Iredell County C&D landfill located in Statesville, North Carolina, and applies to all three phases (Phases 1, 2, and 3) of the construction and demolition (C&D) landfill, and supersedes all previous monitoring plans developed for the subject landfill facility. Sampling and reporting is performed in conjunction with the Iredell County Subtitle D MSW Landfill Phases 1 & 2. The sampling procedures outlined in this analysis plan are guidelines by which sampling will be performed. Deviation from the procedures may be warranted depending on facility conditions or unforeseen sampling variables. Alternative sampling procedures need to conform with the N.C. Water Quality Monitoring Guidance Document for Solid Waste Facilities (Guidance Document).

Note that those ground and surface water monitoring points that have been added to the plan upon the inclusion of the Phase 3 portions of the C&D landfill shall be sampled at least once prior to acceptance of waste in order to provide background information on water quality. All ground and surface water monitoring points, and leachate monitoring points, shall be sampled semi-annually thereafter for the Appendix I list of constituents. Proposed additions to groundwater monitoring plan for Phase 3 include monitoring wells MW-25, MW-26S and MW-26D.

1.2 Water Quality Monitoring Summary

The monitoring plan being discussed in this report consists of thirteen (13) groundwater monitoring wells (MW-1A, MW-1C, MW-9R, MW-9RR, MW-10R, MW-16, MW-22, MW-23, MW-24S, MW-24D, MW-25, MW-26S, and MW-26D), and two (2) surface water monitoring points numbered SW-3 and SW-6. Sampling locations are shown on Plate A. Three (3) monitoring wells MW-25, MW-26S and MW-26D were recently incorporated into the monitoring plan for the inclusion of Phase 3. Monitoring well MW-25, MW-26S and MW-26D were installed during the hydrogeological investigation of the Subtitle D Phase 4 unit in anticipating their inclusion into the sampling plan. Well construction records for the monitoring wells are provided in the appendix. In addition, piezometer P-7, which was retained from the Site Hydrogeologic Study Iredell County C&D Phase 2 & 3 for groundwater levels was abandoned. An exhaustive list of all monitoring points included in this plan is provided as Table E-1.

1.3 Groundwater Monitoring Wells

As mentioned in the previous section, thirteen (13) groundwater monitoring wells are included as part of this monitoring network designated for the entire C&D landfill. The nature of the groundwater flow at the site is generally toward the unnamed creek which is located south and east of the C&D landfill. A single day potentiometric map is provided as Plate B. Monitoring wells MW-1A and MW-1C consist of a nested pair that serves as background, hydraulically upgradient, wells for the Subtitle D Phase 1 & 2 and the C&D portions of the facility. Originally, MW-1B accompanied MW-1A as the shallow member of the nested group, however due to its prolonged dryness was later replaced by MW-1C.

Four (4) monitoring wells (MW-9R, MW-9RR, MW-10R, and MW-16) were installed upon the expansion of the C&D Phase 1 area. MW-9R and MW-10R replaced MW-9 and MW-10, respectively, to accommodate the eastward expansion of the original C&D area that overlapped the locations of the original MW-9 and MW-10. MW-16 was installed to monitor the northeastern addition between the main access road and the stream. MW-9RR was installed as part of a groundwater investigation initiated in response to contamination detected in MW-9R. Trace amounts of cis-1,2-Dichloroethene continue to be detected in MW-9R and MW-9RR. Detected levels are below 15A NCAC 2L, .0202 standards and are in compliance with 15A NCAC 13B Section .0600. Historical detected results from monitoring well MW-9R and MW-9RR and included as Table E-2.

Monitoring wells MW-22, MW-23 MW-24S, and MW-24D-were installed as part of the expansion of C&D Phase 2 for an early detection of contaminant plume that could originate from the aforementioned area. MW-22, MW-23, MW-24S, and MW-24D were semi-equally spaced to achieve maximum efficiency, desirable for an area with relatively uniform groundwater flow.

Monitoring wells---MW-25, MW-26S and MW-26D---were installed in anticipation of expansion into Phase 3. Monitoring well MW-25 was installed as a cross gradient well to detect an potential release prior to reaching the surface water sampling point SW-6 location. Monitoring wells MW-26S and MW-26D were installed as a well cluster for early detection of a release down gradient from Phase 3.

1.4 Surface Water Sampling

Surface water monitoring is conducted to catch potential discharge of leachate from the C&D landfill into the creeks. The previously established surface water monitoring points SW-3 and SW-6 will continue be sampled. SW-3 serves as downstream sampling point for the C&D landfill, and SW-6 serves as the upstream sampling point of the C&D landfill.

1.5 Sampling Equipment

Groundwater samples will be obtained in the field using, stainless steel bailer sanitized in accordance with the following procedure:

1. Completely disassemble bailer.
2. Clean with phosphate-free, laboratory grade soap and organic-free, distilled water wash.
3. Rinse with organic-free, deionized water.
4. Rinse with isopropyl alcohol.
5. Rinse with organic-free, deionized water.
6. Air dry.
7. Wrap bailer in aluminum foil, shiny side out.
8. Wrap bailer in plastic.

The standard equipment necessary to conduct sampling for each well consists of sample containers (including trip blanks and equipment blanks), one wide-mouth container, at least two 600-ft spools of 1/4-inch nylon rope, at least two boxes of latex gloves, one box of large plastic bags, temperature indicator, pH indicator, conductivity indicator, water level indicator, storage coolers, and ice. In case of emergency, supplies to clean bailers as described above may also be brought to the site. If the total depth of all wells to be sampled exceeds 1,200 feet, additional spools of rope will be required to complete the sampling. If the number of wells to be sampled exceeds one third of the number of pairs of gloves in stock, additional boxes of gloves will be necessary. The bailers, wrapped in foil and plastic, will be transported between pieces of peaked foam rubber to prevent damage to the wrappings. All equipment subject to damage and contamination will be transported in sealed, plastic bags.

1.6 Sampling Containers

Ground and surface water monitoring will include organic and inorganic analysis. Samples will be collected for the various analyses in laboratory supplied containers.

1. Each sample container will be labeled providing the following information: site name, county location, sample identification number, parameters to be analyzed, preservative added, date and time of sample, initials of sampler.
2. Samples to be analyzed for organic content will be collected first in three 40-ml glass vials with Teflon caps. The sample vials will be completely filled to create zero head space in vials.
3. Samples to be analyzed for inorganics contamination will be collected second in quart/1-liter polyethylene container.

Each sample container will be clearly labeled providing the site name and county location, well identification number, parameters to be analyzed, preservative added, date and time of sampling, and initials of the sampler. Samples to be analyzed for organic content will be collected in four 40-ml glass vials with Teflon caps. The sample vials will be completely filled with no air left in the vials. Samples to be analyzed for inorganic contamination will be collected in a quart/1-liter polyethylene container, with ½ inch space for air permitted.

All sample containers will be obtained from an independent laboratory in a sterilized condition. Some of the containers will have a pre-measured amount of preservative in them as necessary. In this event, care will be taken not to rinse the container or allow the preservative to wash out during sampling.

2 SAMPLING

Wells will be sampled from upgradient to downgradient, or when previous analytical data is available, from least contaminated to most contaminated. This procedure is required to limit the potential of cross contamination between sampling points.

2.1 Set-Up

A clean sheet of plastic should be placed around the well to provide a clean surface for sampling equipment. The total well depth read from the well tag and the measured depth to water, determined using the water level indicator, will be used to compute the depth of water in the well. The total well depth will be measured and compared to the depth indicated on the well tag as a check for siltation or blockage at depth. The amount of standing water will be calculated by subtracting the depth to water from total depth of well. Gallons of water in the well, as compared to well diameter, will be determined using the chart on Plate D. For example, if a two-inch well is 29 feet deep and has a measured depth to water of 10 feet, there are 19 feet of standing water or 3.3 gallons in the well.

The EPA recommends the indicator parameters: pH, specific conductance, and temperature measured on purged and recovered monitoring wells before collecting samples. When three consecutive measurements are within a 10% range, temperature and specific conductance are considered stable, pH is considered stable when three consecutive measurements are within a range of 0.2 units. All information will be recorded on a field data sheet or in a field logbook with copies submitted to the Division of Waste Management with the analytical results.

All meters will be calibrated immediately prior to purging and sampling and those readings recorded in a field logbook. The meters should be recalibrated at the end of each sampling event and those readings recorded in the log also. Entries will always include pre- and post- calibration readings as well as the model and serial number of the equipment and the date, time, and person performing the calibration(s). Two standards, which bracket the average or suspected measurements for pH and specific conductance, will be used at the site. Additionally, if an equipment blank needs to be run, it should be done before any sampling is started.

2.2 Purging

Purging is done prior to sampling to remove stagnant water from the well, and to introduce fresh groundwater for sampling. Each well will be purged three to five well volumes (quantity of water in the well), or until dry. In the above example, 10 gallons would be adequate.

After determining the amount of water to be purged from a well, the equipment necessary will be assembled including rope, a 5-gallon bucket, bailer, and gloves. Pull the top portion of foil away exposing the eyelet, keeping the bailer in a stable upright position. Using gloved hands: secure rope to the bailer via the eyelet hole and suspend to remove the remaining plastic and foil. These gloves are now contaminated and cannot touch the bailer or the rope. Clean, gloved hands will lower the suspended bailer into the well until the bailer contacts the bottom. Cut a rope to length and secure it to prevent loss of the bailer, again replace contaminated gloves. During purging the rope cannot touch the ground or contaminated surfaces including, dirtied plastics, gloves, boots, etc.; many methods are available and it is to the sampler's discretion which method they prefer. The wind-mill method, looping the rope between thumbs, bucket method, where rope is lowered into a clean plastic bag lining a bucket, or simply placing plastic onto the ground near the well covering shoes, are all commonly used.

If purging and sampling of a well are performed at separate times, the bailer will be left suspended in the well, above the water table, with the rope secured. The remaining rope will be removed, in order to prevent contamination issues. The rope may be doubled and grasped in a tight loop in one hand then covered by pulling the corresponding hands glove on top, inside out. The procedure can be repeated using the other hand if necessary. The glove-encased rope will be set on top of the well head until time to sample. Alternatively, the rope remaining after securing may be gathered in a tight loop and pushed into the 2-inch PVC well pipe and left. Even when sampling immediately follows purging, new gloves will be necessary.

Based on the number of wells to be sampled and their proximity to each other, all the wells may be purged one after another with sampling to follow. In this manner, if a well is purged dry, it may be allowed to recharge prior to sampling.

2.3 Groundwater Sample Collection

Lower the bailer into the well slowly, with gloved hands, to avoid releasing any volatiles from the groundwater; the bailer should not splash or smack the water surface. Once full, the bailer will be retrieved and containers filled by emptying the water through the hole at the bottom of the bailer. To top off the VOC's collect some of the groundwater in the cap and pour it onto the samples contents to acquire the needed meniscus to eliminate air bubbles. The polyethylene containers will be filled and sealed with the cap, leaving about 1/2 inch of airspace at the top. In addition to collecting the samples, water will be collected in the wide-mouth container for pH, temperature, and conductivity measurements. Upon completion of sampling, sample containers will be placed in labeled and sealed plastic bags, including equipment and trip blanks, and stored on ice in coolers. The contaminated latex gloves and rope will be discarded.

2.4 Surface Water Sample Collection

Surface water sampling will be taken with given consideration to minimize turbulence and aeration. Surface water sample containers will be handled with gloves on, keeping one hand near the base; containers will be dipped at location points with extreme caution in order to avoid contamination at the mouth of the container, pushing rapidly at an angle into the water, mouth up, and tilted towards the stream current, fill so as not to lose any of the preservative into the surrounding water. If there is little current movement, the container will be moved slowly through the water laterally. During times of drought, if the water is not deep enough to allow filling of the container, a pool may be scooped out of the bottom of the stream to obtain a sample. The pool will be allowed to clear before sampling. All containers will be filled in the same manner and treated as the ground water samples were. The samples will be sealed in labeled, plastic bags, stored and transported on ice. In addition to collecting the samples, water will be collected in the wide-mouth container for pH, temperature, and conductivity measurements.

2.5 Chain of Custody

Trip blanks, equipment blanks, and sample containers will all travel and be stored together on ice in coolers. Trip blanks will remain in the condition they are received from the laboratory and will not be opened or tampered with during the sampling. A chain-of-custody record will be completed for each day's samples, indicating the date and time, sample location, sample matrix (soil, water, etc.), and laboratory analyses to be conducted. In addition, a field sampling data sheet will be completed indicating the depth to water, pH, temperature, and specific conductivity of the sample measured in the field at each well sampled. Chain of

custody forms are also used to document every time the samples change hands, for example from the sampler to the driver, or from the driver to the laboratory.

3 ANALYSIS

When the water samples reach the laboratory, they will be transferred to a sample custodian who will sign the chain of custody documentation as receipt of the samples. Internal control of the water samples in the laboratory will be in accordance with QA/QC procedures for the laboratory. Copies of QA/QC manuals for approved laboratories are on file at the Division of Solid Waste. Groundwater and surface water will be analyzed for the Appendix I list of chemical constituents. QA/QC procedures utilized during the testing will be in conformance with laboratory QA/QC manual.

4 CONCLUSION

This report was completed as part of the Permit Application for the Iredell County C&D Phase 3. The ground and surface water monitoring plan is designed to be effective in the early detection of any possible release of hazardous constituents to the uppermost aquifer.

MUNICIPAL ENGINEERING SERVICES COMPANY, P.A.

Ethan J. Caldwell, P.G.
Professional Geologist

Table E-1. Summary of ground and surface water monitoring points

Sampling Point	Type	Gradient	Total Depth (ft)
MW-1A	Monitoring Well	Up	39
MW-1C	Monitoring Well	Up	34
MW-9R	Monitoring Well	Down	20
MW-9RR	Monitoring Well	Down	22
MW-10R	Monitoring Well	Down	25
MW-16	Monitoring Well	Down	20
MW-22	Monitoring Well	Down	37
MW-23	Monitoring Well	Down	23
MW-24S	Monitoring Well	Down	16
MW-24D	Monitoring Well	Down	38
MW-25	Monitoring Well	Cross	25
MW-26S	Monitoring Well	Down	20.25
MW-26D	Monitoring Well	Down	61.75
SW-3	Surface Water	DownSteam	
SW-6	Surface Water	Upstream Stream	

Table E-2. Summary of Historic VOC's detected in MW-9R and MW-9RR

MEMORANDUM

To: Ed Mussler

From: Brian Wootton

Subject: Application for Permit to Construct,
Iredell County – C&D Landfill
Proposed Phase 3 Extension
Design Hydrogeologic Study - Final Comments
Water Quality Monitoring Plan – Additional Information Requested

I have reviewed the Permit to Construct Application (proposed addition of Phase 3) in-part for hydrogeologic concerns. I received the application on July 12, 2006 and subsequent supporting information was received on October 11, 2006. The hydrogeologic Site Suitability Report was approved for Phase 2 and 3 on January 28, 2004. According to that study, much of the hydrogeological site and design requirements have been met for Phase 3.

The revised surface and groundwater monitoring plan (revised October 10, 2006), explains that groundwater monitoring wells, MW-25, MW-26S, MW-26D, have been added to the monitoring plan. According to well construction records submitted, these new wells were constructed properly. The piezometers that were used for investigative purposes, within the footprint of Phase 3 have been abandoned (sealed) properly and well abandonment forms have been submitted. According to the revised surface and groundwater monitoring plan; page 1, condition 1.2 (Water Quality Monitoring Summary), 13 groundwater monitoring wells, (MW-1A, MW-1C, MW-9R, MW-9RR, MW-10R, MW-16, MW-22, MW-23, MW-24S, MW-24D, MW-25, MW-26S, MW-26D) and two surface water monitoring points , SW-3 and SW-6 are associated with C&D phases 1, 2, and 3.

In conclusion, standard Permit to Construct and Pre-Operational conditions shall apply with the exception, the new monitor wells (MW-25, MW-26S, MW-26D) have already been constructed and well completion forms submitted; however, initial sampling of the new groundwater wells will need to be required prior to Permit to Operate.

==========

Please contact me with any questions or comments. I can be reached at (919) 508-8524 or by e-mail.

Sincerely,

Brian Wootton

RE: Permit Application – Construction And Demolition Landfill – Phase 3
Iredell County
Permit No. 49-03

Dear Mr. Woodie

The above referenced permit application for the proposed Phase 3 expansion of the Construction and Debris Landfill, submitted by Municipal Engineering Services Company, P.A., on behalf of Iredell County is being reviewed by the Solid Waste Section (SWS) for hydrogeologic and engineering concerns. There are several items in the application that require clarification and/or revision before the review can be completed. Please respond to the following questions and comments:

Section 2- Written Report – (i)
Page 5

Part (i) of the Written Report states the following: *"A survey plat and deed for this property has been included in this section".*

A copy of the survey plat and deed could not be located in the application or I overlooked it during review of the application. Please provide copie(s) or clarification.

Also, depict on this map or an additional map the acreage of the footprint for Phase 3.

Section 3 – Operational Plan for Iredell County – 3
Page 12

Page 12 of the Operational Plan mentions, in part, the frequency of surface and ground-water sampling.

Additional ground-water well(s) and surface water sampling point(s) may be required to monitor any potential impacts to surface water and groundwater from Phase 3 landfill operations. Submit a written discussion and possible revised Water Quality Plan (that includes Phase 3) explaining the reasoning and possible necessity of additional ground-water wells and surface water sampling points.

Also, provide the most current map, depicting the location of existing and proposed locations of ground-water sampling wells and surface water sampling points associated with this phase, and adjacent phases.

If additional ground-water and surface sampling points are required, then installation of well(s) and sampling will be required before a Permit to Operate is issued.

The drawings submitted with the application do not depict locations of borings, piezometers/wells inside the waste boundary of proposed Phase 3. Please clarify by stating whether or not previous existing wells, piezometers, and borings have been abandoned (sealed) correctly within the proposed footprint of proposed Phase 3.

Please note the comments and questions stated above and provide additional information and revisions as needed. If you and your staff have any questions, or wish to schedule a meeting to discuss the items referenced in this letter, please call me at 919-508-8524.

Sincerely,

Brian Wootton
