### A3. DISTRIBUTION LIST

1 The following individuals will receive copies of the approved QAPP and  
2 subsequent revisions:

- 3 • Aaryn Jones, Brownfields Project Officer, EPA Region 4, 109 T.W.  
4 Alexander Drive, Research Triangle Park, NC 27711, Phone: (919) 541-  
5 0066, Email: [jones.aaryn@epa.gov](mailto:jones.aaryn@epa.gov)
- 6 • EPA DAO, EPA – Region 4, Atlanta Federal Building, 61 Forsyth Street  
7 Southwest, Atlanta, GA 30303, Phone: (800) 241-1754
- 8 • Sharon Eckard, Brownfields Project manager, North Carolina Department  
9 of Environment and Natural Resources (NCDENR), Division of Waste  
10 Management, 1646 Mail Service Center Raleigh, NC 27699-1646, Phone:  
11 (8919) 707-8379, Email: [Sharon.eckard@ncdenr.gov](mailto:Sharon.eckard@ncdenr.gov)
- 12 • Mayor Lonnie B. English, Town of Robbins Brownfields Director, Town of  
13 Robbins (Town), 101 North Middleton Street, Robbins, NC 27325, Phone:  
14 (910) 571-1649, Email: [lenglish@mountaire.com](mailto:lenglish@mountaire.com)
- 15 • M. Shane Dixon, Cardno Project Manager, 1233 Washington St, Suite  
16 1000, Columbia SC 29201, Phone: (803) 929-6058, Email:  
17 [Shane.Dixon@cardno.com](mailto:Shane.Dixon@cardno.com)
- 18 • Rick Hagberg, PG, Cardno Quality Assurance/Quality Control (QA/QC)  
19 Manager, 380 Park Place Boulevard, Suite 300, Clearwater, FL, 33759,  
20 Phone: (727)431-1549, Email: [rick.habgerg@cardno.com](mailto:rick.habgerg@cardno.com)
- 21 • Field Team Leader/Technician, information will be submitted in Site-  
22 specific QAPP Addendum
- 23 • Field Team Technicians, information will be submitted in Site-specific  
24 QAPP Addendum
- 25 • Laboratory Director, information will be submitted in Site-specific QAPP  
26 Addendum

### 27 A4. PROJECT/TASK ORGANIZATION

28 Cardno is responsible for conducting and overseeing the Phase I and Phase II  
29 Environmental Site Assessments (ESAs) funded by the brownfields project. The  
30 information presented in this document represents the minimum standards required for  
31 the completion of ESAs under the Town's brownfields program. A project organization  
32 chart is provided as **Figure 1**. The following are the individuals participating in the  
33 project and their specific roles and responsibilities:

34 **Aaryn Jones, EPA Region 4 Brownfields Project Officer** - The EPA Project Officer is

1 responsible for overseeing and monitoring the grant. As part of that responsibility, she  
2 ensures the processes described in the work plan are followed and the terms and  
3 conditions of the grant are met.

4 **EPA Region 4 Brownfields Designated Approving Official** – The Brownfields Region  
5 4 Quality Assurance Manager's DAO provides technical assistance to the Region 4  
6 Project Officer working on Brownfields sites. The DAO's role is to provide technical  
7 reviews of the Generic QAPPs and Site-specific QAPP Addenda that are generated.  
8 This includes the approval of the Generic QAPP and Site-specific QAPP Addenda and  
9 any revisions.

10 **Sharon Eckard, NCDENR Brownfields Project Manager** – This individual is involved  
11 in the review and approval of the final site assessment plan(s), Site-specific QAPP  
12 Addenda, and report(s). This individual also ensures that plans are in compliance with  
13 the current NCDENR rules and regulations. If a potential purchaser is pursuing a  
14 Brownfields Agreement with NCDENR, this individual is involved in scoping the  
15 necessary assessment and cleanup requirements to achieve the agreement.

16 **Mayor Lonnie B. English, Town of Robbins Brownfields Director** – The Town of  
17 Robbins Brownfields Director (Director) is responsible for the overall strategic direction  
18 of the project. The Director ensures project activities are executed in accordance with  
19 the approved Work Plan and the Terms and Conditions of the Cooperative Agreement.

20 **M. Shane Dixon, Cardno Project Manager** – The Cardno Project Manager (Project  
21 Manger) will be the primary decision maker for the project and the primary user of the  
22 data to determine whether or not further action is required at the site. This individual will  
23 also coordinate the project activities and will have overall responsibility of the  
24 investigation. This individual's specific responsibilities are as follows:

- 25 1. Approving the QAPP and subsequent revisions;
- 26 2. Developing the Site-Specific Health and Safety Plan (HASP);
- 27 3. Ensuring project activities are conducted in accordance with the QAPP;
- 28 4. Coordinating corrective actions outside of standard operating procedures with the  
29 Field Team leader, and coordinating with the Laboratory Director to correct any  
30 corresponding problems encountered in the chemical analyses;
- 31 5. Coordinating the corrective actions for problems that may affect the established  
32 data quality objectives;
- 33 6. Developing and submitting a final assessment report, detailing all field and lab  
34 activities, results, and conclusions;
- 35 7. Reporting to the EPA Project Manager, NCDENR Project Manager, and Town of  
36 Robbins Brownfields Director regarding the project status; and,
- 37 8. Making final project decisions with the authority to commit the necessary  
38 resources to conduct the project.

39 **Rick Hagberg, PG, Cardno QA/QC Manager** – The Cardno QA/QC Manager (QA/QC  
40 Manger) provides documentation audits and technical review to assist in promoting,  
41 implementing, and documenting QA compliance. The QA/QC Manager is isolated from  
42 the implementation Project Manager. This allows lateral support as a peer to the Project  
43 Manager without introducing unintentional biases from conducting the work. The QA/QC

1 Manager must have extensive environmental and regulatory assessment experience at  
2 both the state and federal levels. The QA/QC Manager reviews the data validation for  
3 the project.

4 **Field Team Leader** – The Field Team Leader is identified in the Site-specific QAPP  
5 Addenda. The Field Team Leader reports to the Project Manager and performs the  
6 following duties:

- 7 1. Selecting and supervising the Field Team Technicians;
- 8 2. Distributing the approved QAPP and subsequent revisions to the members of the  
9 Field Team Technicians;
- 10 3. Conducting the field activities per the approved QAPP;
- 11 4. Reporting the status of field activities to the Project Manager;
- 12 5. Implementing corrective actions within standard operating procedures in the field,  
13 documenting corrective actions in the field logs, and providing documentation to  
14 the Project Manager; and
- 15 6. Coordinating corrective actions outside of standard operating procedures with the  
16 Project Manager, instituting corrective actions; documenting corrective actions in  
17 the field logs, and providing documentation to the Project Manager.

18 **Field Team Technicians** – These individuals will perform the actual fieldwork per the  
19 QAPP and at the direction of the Field Team Leader. The field team typically consists of  
20 two to four people, who are selected by the Field team Leader once the field team  
21 activities are scheduled.

22 **Laboratory Director** – The Laboratory Director will be identified in the Site-specific  
23 QAPP Addenda. The Laboratory Director is responsible for the following:

- 24 1. Coordinating the analysis of the samples and selecting the analytical team.
- 25 2. Coordinating the receipt of the samples at the laboratory.
- 26 3. Ensuring internal laboratory audits are conducted per the Laboratory's Quality  
27 Assurance Manual (QAM), and distributing the applicable sections of the QAPP  
28 and subsequent revisions to members of the analytical team.
- 29 4. Instituting corrective actions for problems encountered in the chemical analyses  
30 and reporting laboratory problems affecting the project data to the Project  
31 Manager. Corrective actions for chemical analyses will be detailed in a lab report  
32 that will be provided via electronic mail.

## 33 **A5. PROBLEM DEFINITION/BACKGROUND**

34 The problem definition/background information will be detailed in the Site-specific QAPP  
35 Addenda.

## 36 **A6. PROJECT/TASK DESCRIPTION AND SCHEDULE**

37 The project/task description and schedule will be detailed in the Site-specific QAPP  
38 Addenda.

39

1 **A7. SPECIAL TRAINING REQUIREMENTS/CERTIFICATION**

2 The following are the minimum training requirements for personnel conducting project  
3 activities. Current training records and certificates are kept in personnel files located at  
4 the respective headquarters of the project personnel. Deficiencies and the need for new  
5 training are identified during annual personnel evaluations. Personnel deficient in any of  
6 the following requirements will not conduct project activities.

7 Hazardous Waste Operations and Emergency Response (HAZWOPER):

8 The Field Team Leader will ensure that all on-site project personnel have current  
9 certificates of training for the 40-hour Occupational Safety and Health Administration  
10 (OSHA) HAZWOPER Training Class with annual 8-hour refresher courses. All  
11 personnel mobilizing to the site shall carry a Certificate of Training identification card.

12 Field Team Training:

13 Field Team Technicians are provided hands-on training in graduated phases of  
14 explaining, observing, demonstrating, and performing field sampling techniques and  
15 standard operating procedures by experienced field personnel. Additional training in  
16 field equipment technologies, quality assurance, ethics, and other skills are provided  
17 through in-house instruction, online, and external workshops and courses. Field  
18 competency is checked through personnel evaluations with direct input from the field  
19 team leaders and project managers.

20 Certifications:

- 21 • Assessment work must be overseen by a NC-licensed professional, and the final  
22 assessment reports will be signed and sealed by either a professional geologist  
23 (P.G.) or a professional engineer (P.E.) licensed in the State of North Carolina.
- 24 • A North Carolina-licensed driller will perform the drilling tasks for this project.  
25 Licensure of the subcontracted drilling operator will be confirmed during the  
26 solicitation for the drilling services.
- 27 • An NCDENR-accredited environmental laboratory will perform the analysis of the  
28 environmental samples in compliance with all applicable regulations and  
29 standards. As sites are selected for assessment, Cardno will issue a competitive  
30 request for qualifications and quotes to analytical laboratories to support the  
31 project. The selected laboratory's QAM will be included as an attachment in  
32 electronic format to the Site-specific QAPP Addenda.

33 Quality assurance training is of utmost importance for valid handling of data. As such,  
34 staff members receive QA training on an as-needed basis by taking online courses as  
35 well as attending professional training when offered.

36 The Town will be responsible for ensuring that their brownfields program personnel have  
37 valid and current specialized training required by the OSHA regulations as a pre-  
38 requisite for site visit(s). Additional specific certifications have not been identified as  
39 necessary during the planning of this project.

1 If needed, special training or certifications required for a specific site assessment will be  
2 identified in the Site-specific QAPP Addenda.

### 3 **A8. DOCUMENTS AND RECORDS**

4 All project personnel are responsible for proper documentation in accordance with their  
5 roles. **Table 1** provides a list of the project documents and records that will be  
6 generated and the purpose of each. Commonly used forms are provided in Attachment  
7 B. Document and records requirements are also maintained per US EPA Region 4,  
8 Science and Ecosystem Support Division (SESD), Field Branches Quality System and  
9 Technical Procedures, December 2008 specifications. Some of the required  
10 documentation includes:

11 Field crew signs or initials all records/notes with a waterproof pen;

- 12 • Use of field sampling and decontamination supplies, and equipment are tracked  
13 with an in-house system;
- 14 • Sampling containers are prepared by the laboratory and shipped with a packing  
15 list documenting contents;
- 16 • Preservatives used by the laboratory are traceable by preparation date, Vendor,  
17 and lot number;
- 18 • Sampling containers are pre-cleaned at the laboratory;
- 19 • Water level indicator and field parameter meters are cleaned according to  
20 specifications and documentation is contained in the field notes; and
- 21 • All equipment is maintained and calibrated in accordance with manufacturers'  
22 specifications.

23 Chain-of-custody forms accompany all samples from origin through disposal. All sample  
24 containers are labeled with sample location ID, preservative, sampler name, analyses  
25 required, and date/time of collection. The sample location ID is linked to the labels,  
26 chain-of-custody, and field notes. The chain-of-custody form includes the following  
27 information:

- 28 • Project name and address
- 29 • Date and times of sample collection
- 30 • Name of sampler
- 31 • Sample location ID
- 32 • Number of samples
- 33 • Analyses required
- 34 • Preservation method
- 35 • Timeframe (days) sample results are needed within
- 36 • Comments

37 Field notes are recorded during all site visits and include:

- 38 • Names of personnel, subcontractors, and others on-site
- 39 • Date and chronological summary of field activities
- 40 • Ambient conditions

- 1 • Sample location descriptions and sample ID
- 2 • Lithology
- 3 • Field measurement data
- 4 • Sample order
- 5 • Purging and sampling equipment
- 6 • Field decontamination procedures
- 7 • Field calibration records
- 8 • Types of quality control samples collected
- 9 • Sampler signatures
- 10 • Results of QC checks
- 11 • Documentation of all problems encountered in the field with corrective action
- 12 resolution

13 Field logs and notes will be recorded in a dedicated, bound field book with sequentially  
14 numbered pages. Field logs will include all field measurements and weather  
15 observations at the site when field activities were conducted. All relevant observations  
16 or digressions from the procedures in this QAPP, deemed notable by any field team  
17 member, will also be recorded in the field logbook. Each page of the field logs will be  
18 dated and signed by the person making the entries. The project specific approved  
19 QAPP will be located onsite during field activities. The field book will be retained in the  
20 physical project file. Monitoring well installation and sampling sheets are recorded and  
21 include:

- 22 • Well casing material, diameter, screened interval, and total depth
- 23 • Drilling methods and lithology
- 24 • Water table depth
- 25 • Calculation of purge volume and sampling procedures
- 26 • Field parameter measurements and equipment used
- 27 • Sampling date
- 28 • Observations

29 Samples collected are immediately placed in laboratory provided coolers and chilled to  
30 four degrees Celsius using wet ice. Chain-of-custody information accompanies the  
31 samples; upon receipt of the samples and chain-of-custody information, the laboratory:

- 32 • Checks sample container integrity, temperature, and documentation
- 33 • Verifies the sample preservatives
- 34 • Logs receipt of the samples
- 35 • E-mails a .pdf file copy of the chain-of-custody and login information

36 Upon receipt of the e-mail confirmation, the Project Manager and QA/QC Manager will  
37 review the .pdf versions of the chain-of-custody and laboratory login information for  
38 consistency with the internal work order that documented the sampling work and  
39 analyses to be conducted during that field event.

40 The laboratory provides both electronic and paper copies of the analytical results  
41 generally within 10 to 14 days of sample receipt. A project timeline, including timeframe

1 of analytical data receipt, will be provided in the Site-specific QAPP, as it is dependent  
2 on the laboratory used on the project and is also dependent on the consultant's  
3 agreement with the laboratory. Upon receipt, Laboratory Data are reviewed by the  
4 Project Manager and QA/QC Manager. The electronic copy is placed in the project file  
5 maintained on the server, which is routinely "backed up" to ensure data integrity. The  
6 paper version of the results is maintained in the physical project file, which is eventually  
7 archived for a period of five years after the approval of the final report.

8 Types of information requested from the laboratory include:

- 9 • Analytical result sheets
- 10 • Method blank results
- 11 • Surrogate recoveries and acceptance limits
- 12 • Matrix spike/matrix spike duplicate results and acceptance limits
- 13 • Spike/Duplicate results and acceptance limits
- 14 • Laboratory control sample results and acceptance limits
- 15 • ICP serial dilution results
- 16 • ICP interference check samples
- 17 • Project narrative containing observations and explanation of any data qualifiers
- 18 • Signature by laboratory quality assurance officer

19 The laboratory analytical report will be submitted to the Project Manager. The narrative  
20 report will describe at least:

- 21 1. The dates of sample receipt, preparation, and analysis
- 22 2. The condition of the samples upon receipt
- 23 3. Sample preparation and analysis
- 24 4. Any problems encountered during sampling handling, storage, preparation, or  
25 analysis, and their solution
- 26 5. Any variance from the standard operating procedures
- 27 6. And a discussion of the quality of the reported analytical data

28 Project records will include all correspondence, field logs/data sheets, laboratory  
29 analytical reports, and a final report.

30 The Project Manager will complete a field activity report within 30 days of completion of  
31 the field activities as described in the Site-Specific QAPP. This report will include the  
32 analytical data report, a signed narrative about field activities, a summary of all collected  
33 field data, a written report of the audit of field activities (see Section CI), and copies of  
34 the original field log books and field data worksheets for this project. The narrative  
35 report will include at least discussions of all field activities, any problems encountered  
36 and their solutions, any divergences from QAPP procedures, and a discussion of field  
37 data quality.

38 The Project Manager will distribute copies of the Site-Specific QAPP to the people listed  
39 in the distribution list (see Section A3) once it is approved. Any revisions to this Generic  
40 QAPP or to the Site-Specific QAPP will be documented as *revised* with corresponding  
41 revision number (*revision #1*). It will be the responsibility of the Project Manager to see

- 1 to it that each person on the distribution list receives copies of any revisions.
- 2 The laboratory will manage the original raw data from this project in both hard copy and  
3 electronic format. The Laboratory Director will retain information on where the records  
4 are stored, who will be responsible for records management, and how long specific  
5 types of records or documents will be maintained.
- 6 All records and reports can be found in the physical project file located at the Project  
7 Manager's office. Electronic records shall be maintained on the company network or  
8 computers. After approval of the final report, the project file will be archived for a period  
9 of five years.
- 10 The Project Manager will maintain a copy of the final report in the project file located in  
11 the headquarters office in Columbia, South Carolina, until the completion of the  
12 cooperative agreement. The project file will then be archived for a period of five years.
- 13 The Project Manager will submit copies of all records and reports to the NCDENR  
14 Brownfields Project Manager (if a Brownfields Agreement is executed) and EPA Project  
15 Manager with the field activity report. The NCDENR Project Manager will approve  
16 deviations from these procedures before implementation, if applicable.

## 17 **B1. SAMPLING DESIGN PROCESS**

- 18 The sampling design process and site figures will be detailed in the Site-specific QAPP  
19 Addenda.

## 20 **B2. SAMPLING AND ANALYTICAL METHODS REQUIREMENTS**

- 21 The US EPA Region 4, Science and Environmental Services Division (SESD), Field  
22 Branches Quality System and Technical Procedures, provides procedures for routine  
23 field sampling and measurement (Attachment A), including field sample collection and  
24 equipment decontamination procedures. The techniques presented in this document will  
25 be followed during the field sampling events.
- 26 The purpose of performing environmental site investigations is to determine the  
27 presence, identity, and concentration of contaminants along with the extent to which  
28 they have become integrated into the surrounding environment. The objective of this  
29 effort is to collect and analyze samples which are representative of the environmental  
30 medium under investigation. The methods and equipment used for sampling  
31 environmental matrices vary with the associated physical and chemical properties of the  
32 Contaminants of Concern (COCs). Preservation, extraction, and digestion methods will  
33 be in accordance with the EPA SW-846 requirements for each method. Specific  
34 sampling procedures and the list of equipment required will be included as part of the  
35 Site-specific QAPP Addendum for the project site. If any sampling problems or  
36 abnormalities occur during sampling, the Field Team Leader will use the decision tree  
37 included in Section C1 to determine the appropriate level of responsibility to make  
38 corrective action decisions.

1 **Table 3** provides details on sampling containers, collection volumes, holding times, and  
2 preservation requirements by matrix for methods commonly used on brownfield projects.  
3 Sample containers will be provided by the laboratory. Sample containers and  
4 preservation will be based on EPA SW-846 requirements and the specific requirements  
5 listed in the selected methods. The containers will be examined upon receipt to ensure  
6 that the appropriate number and type of containers have been provided to meet the  
7 sampling needs. The containers will also be checked to ensure that preservative has  
8 been added, if required. Additional details will be included in the Site-specific QAPP  
9 Addenda, if needed.

10 If any sampling problems or abnormalities occur during sampling, the Field Team  
11 Leader will use the decision tree included in Section C1 to determine the appropriate  
12 level of responsibility to make corrective action decisions. Due to the proximity of the  
13 project sites to the field technicians' facilities and the short duration of the environmental  
14 assessments, on-site support facilities will not be required unless stated otherwise in the  
15 Site-specific QAPP Addenda.

16 Additions to sampling personnel, sampling equipment, sampling parameters, or any  
17 other unforeseen variables will be included in the Site-specific QAPP Addenda, as  
18 needed.

### 19 **B3. SAMPLE HANDLING AND CUSTODY REQUIREMENTS**

20 Accountability for a sample begins when a sample is taken from its natural environment.  
21 The documentation procedures used to record the field sampling events are described  
22 in this section. Accurate sample documentation requires sufficient personnel, time, and  
23 space for processing forms and packaging samples. Sample containers should be  
24 organized prior to initiating the sampling activities. The following sample handling and  
25 custody procedures will be followed once the sample is collected during the  
26 implementation of this project:

#### 27 **Sample Numbering**

28 Each sample will be assigned a unique identification code based on the site and its  
29 sample location. Specific sample numbering schemes will be detailed in the Site-  
30 specific QAPP Addenda.

#### 31 **Sample Labels**

32 Each sample container will have a sample label affixed to it to provide sample  
33 identification, sample type, parameter(s), location, sampler's initials, date, time, and  
34 preservation. The laboratory will provide its own specific sample labels pre-affixed to the  
35 appropriate container(s). An example sample label is included in Attachment B.

#### 36 **Custody Seals**

37 Custody seals will typically be used to help ensure the integrity of samples. This  
38 procedure may include seals on individual samples or on containers used to transport  
39 samples. An example of a typical custody seal is included in Attachment B.

#### 40 **Chain of Custody**

41 Chain of custody procedures are intended to document sample possession in

1 accordance with federal guidelines from the time of collection to the time of disposal. For  
2 the purpose of this project, a sample is considered in custody if it is as follows:

- 3 • In one's actual possession;
- 4 • In view, after being in physical possession;
- 5 • Locked so that no one can tamper with it, after having been in physical custody;
- 6 and/or
- 7 • In a secured area, restricted to authorized personnel.

8 A chain of custody record will be supplied by the analytical laboratory (an example of a  
9 blank form is included in Attachment B) and will be used to document and track  
10 possession of the samples. The chain of custody record will be sent with each sample  
11 shipment from the field to the laboratory and will serve as a record for the receipt of  
12 samples by the laboratory. The chain of custody record will include the following types of  
13 information:

- 14 • Sample numbers
- 15 • Signature of sampling team member submitting samples
- 16 • Date and time of collection
- 17 • Sample media (soil, solid, liquid, wipe, etc.)
- 18 • Identification of sampling point
- 19 • Number of containers
- 20 • Any special handling required
- 21 • Signatures of persons involved in the chain of possession
- 22 • Inclusive dates and times of possession
- 23 • Notations regarding sample integrity, such as leaking or broken containers or
- 24 bags

25 The chain of custody will be signed each time the samples are transferred and received.  
26 The bill of lading for commercial overnight delivery services will be adequate to  
27 document possession and control of the samples during transport to the laboratory.

### 28 **Sample Storage**

29 Sample containers will be held in a refrigerator or cooler filled with ice until they are  
30 shipped. Appropriate shipping containers for samples include insulated polypropylene or  
31 aluminum-clad chests. The chests should contain ice in a sealed container or other  
32 cooling source to maintain a temperature of 4°C in the container to help prevent  
33 degradation of the samples.

### 34 **Sample Transportation/Shipment**

35 Samples to be shipped for analysis will be handled and packaged in a manner that  
36 maintains a complete chain of custody record and prevents damage during shipment. All  
37 samples will be transported directly to the laboratory or by using a commercial carrier.  
38 When using a commercial carrier, a custody seal will be used to preserve the integrity of  
39 the sample from the time it is collected until the container is opened in the laboratory. All  
40 samples from the site will be shipped in polypropylene (or equivalent) coolers or  
41 shipping containers. As long as the custody seals are intact, commercial carriers are not  
42 required to sign the custody form. Seals will be attached so that it is necessary to break

1 the seal to open the container.

2 **Sample Non-Conformance**

3 In the event that the laboratory sample custodian judges that the sample custody is  
4 invalid, non-conformance documentation will be initiated. The Project Manager will then  
5 be notified. The decision will be made by the Project Manager as to the fate of the  
6 sample(s) in question. The sample(s) will either be processed "as is" with custody failure  
7 noted along with the analytical data or rejected with re-sampling scheduled, if  
8 necessary.

9 **Sample Destruction**

10 Samples will not be kept by the laboratory for an undetermined amount of time.  
11 Therefore, samples will be disposed of by the laboratory and not returned. There is no  
12 final documentation sent by the laboratory to confirm disposal.

13 **B4. ANALYTICAL METHODS AND REQUIREMENTS**

14 Once the samples are received and logged in at the laboratory, the samples will be  
15 analyzed by EPA Methods as specified in the Site-specific QAPP Addenda. A listing of  
16 analytical methodologies to be followed for the analytes of concern and the required  
17 instrumentation for each site will be provided in the Site-specific QAPP Addenda. If a  
18 non-standard or unpublished methodology is proposed for a given study, then the  
19 validation criteria for that methodology will be provided in the Site-specific QAPP  
20 Addenda. The laboratory will supply results of analyses within 14 calendar days  
21 (standard turnaround time).

22 The laboratory will follow the procedures outlined in their QAM (to be included in the  
23 Site-specific QAPP Addenda). The Laboratory Director will be responsible for  
24 overseeing the laboratory analysis and implementing corrective actions per their QAM.

25 **B5. FIELD QUALITY CONTROL REQUIREMENTS**

26 Field quality control requirements are detailed in **Table 4**. Specific field quality control  
27 requirements will be further defined in the Site-specific QAPP Addendum for each site.  
28 The Addendum will specify the media, type, number, and frequency of field quality  
29 control samples based on the specific conditions of the project site.

30 **B6. LABORATORY QUALITY CONTROL REQUIREMENTS**

31 The laboratory will be selected on a site-by-site basis. As such, the laboratory QAM will  
32 be included with the Site-specific QAPP Addenda. The Site-specific QAPP Addenda will  
33 reference the appropriate sections of the laboratory QAM which detail the laboratory QC  
34 requirements. If the information is not included in the laboratory QAM, the information  
35 will be detailed in Section B6 of the Site-specific QAPP Addenda. To monitor the  
36 achievement of the data quality objectives identified in the Site-specific QAPP Addenda,  
37 precision, accuracy, representativeness, completeness, and comparability will be  
38 assessed in accordance with the previously cited sections of each laboratory's QAM.  
39 Precision will be assessed by examining field and matrix spike duplicate (MSD)  
40 analytical results. Laboratory accuracy will be assessed by performing recovery studies,

1 including matrix spike (MS), laboratory control samples, and laboratory method blank  
2 analytical results. The Site-specific QAPP Addenda will provide a table with ranges of  
3 precision and accuracy considered acceptable for the CoC. If quality issues are  
4 identified, the laboratory will follow the corrective action procedures detailed in their  
5 QAM.

## 6 **B7. FIELD EQUIPMENT AND CORRECTIVE ACTION**

7 A list of common field equipment and the associated preventative maintenance for each  
8 is provided in **Table 5**. Calibration criteria (standards, frequency, acceptance limits, and  
9 adjustment procedures) and corrective actions when equipment does not meet control  
10 limits are also provided in **Table 6**. Updated tables will be provided in the Site-specific  
11 QAPP Addenda to detail the specific equipment and procedures to be used for each site  
12 assessment.

13 Equipment that fails in the field is immediately set aside, while field personnel contact  
14 the appropriate manufacturing company for guidance on repair. If the repair is  
15 successful, the equipment is recalibrated and put back into use. If the repair is  
16 unsuccessful, a replacement is requested and shipped overnight.

## 17 **B8. LAB EQUIPMENT AND CORRECTIVE ACTION**

18 The Site-specific QAPP Addenda will reference the appropriate sections of the  
19 laboratory QAM which address the calibration procedures and frequency for laboratory  
20 equipment, the preventative maintenance of laboratory equipment, and the corrective  
21 action procedures. If the information is not included in the laboratory QAM, the  
22 information will be detailed in Section B8 of the Site-specific QAPP Addenda.

## 23 **B9. ANALYTICAL SENSITIVITY AND PROJECT CRITERIA**

24 The Site-specific QAPP Addenda will reference the appropriate sections of the  
25 laboratory QAM which contain a discussion of analytical method sensitivity. If the  
26 information is not included in the laboratory QAM, the information will be detailed in  
27 Section B9 of the Site-specific QAPP Addenda. An analytical method sensitivity and  
28 project criteria table for the specific analytical methods to be used for each site will also  
29 be included in the Site-specific QAPP Addenda.

## 30 **B10. DATA MANAGEMENT AND DOCUMENTS**

31 Project documents and records will be generated in the field, in the laboratory, and in  
32 the office during the review and analysis of the data.

### 33 **Field Documents and Records**

34 Field personnel will maintain appropriate documents and records for the sampling  
35 events. Written field records will be the primary source for sample information. All  
36 information concerning the sampling event will be recorded in the field records and kept  
37 in a field notebook. The person responsible for the entries will sign and date each entry.  
38 Field records will contain sufficient information to reconstruct the sampling event, if  
39 necessary. Field records will be kept in a field team member's possession or in a secure

1 place during the period of the investigation. At the conclusion of the investigation, the  
2 field records will become part of the file for the project.

3 All original, recorded data will be written with waterproof ink. Accountable serialized  
4 documents will not be destroyed or thrown away, even if they are illegible or contain  
5 inaccuracies that require a replacement document. If an error is made on an  
6 accountable document, the individual will make corrections by drawing a line through the  
7 error, entering the correct information, and initialing and dating the correction. The  
8 erroneous information should not be made unreadable. Any error on an accountable  
9 document will be corrected by the person who made the entry. All corrections will be  
10 initialed and dated.

11 Documentation of sampling activities will include the use of the following basic items:

- 12 • Sample label
- 13 • Field data sheet
- 14 • Boring log
- 15 • Chain of custody forms
- 16 • Field sketches (optional)
- 17 • Photo log (optional)
- 18 • Analytical request form (optional)

19 A logical and complete sample identification system will be implemented for the project.  
20 The system will identify the sample matrix, sample station number, sample depth, quality  
21 control samples, and the sampling date, time, and location for each sample. The sample  
22 label, field sheet, sample log, chain of custody forms, and analytical request forms must  
23 all include the complete sample identification information.

24 Information related to each sample location will be documented in a bound field book. A  
25 field sheet will be referenced in the field book if one is used. The field book or sheets will  
26 include the following information where applicable: odors, soil descriptions, well  
27 construction details, water quality parameters, purge times, estimated purge volumes,  
28 property ownership information, exact sample locations, and analyses to be performed.  
29 In addition, the field record will include the weather and temperature conditions at the  
30 time of sampling. Any photographic documentation will also be recorded in the field  
31 record.

32 Special emphasis must be placed on precise identification and description of QC  
33 samples in the field sheets. Program "blind" duplicate samples should not be identified  
34 as such to the laboratory or on the chain of custody forms, but must be distinguishable  
35 in the project-level documentation. The field sheets must contain descriptions of how the  
36 QC samples were collected and notes as to how the samples were named or numbered  
37 for analysis.

38 All original field documents will be saved in the project file. Digital photographic  
39 documentation will also be stored in the electronic project file. Copies of the field records  
40 will be included in the final report.

#### 41 **Laboratory Documents and Records**

1 At a minimum, the laboratory will provide data reports consisting of a summary package  
2 which includes the following:

- 3 • Cover letter/case narrative listing the samples submitted and analyses performed.
- 4 • Laboratory results summary listing the sample identifications, analysis methods,  
5 results of the analysis, the detection limit/practical quantitation limits, and dates of  
6 sample collection, extraction and analysis for each analyte.
- 7 • A copy of the chain of custody showing acceptance by the laboratory.
- 8 • A QA/QC summary that presents applicable surrogate recoveries, blank results,  
9 matrix spike/matrix spike duplicate (MS/MSD), or laboratory control sample (LCS)  
10 results along with the acceptable quality control limits. **Table 2** summarizes the  
11 quality control data provided by the laboratory.

12 Internal laboratory sample identification data must track against the chain of custody  
13 information, such that the sample may be traced back to its originating field information  
14 and sampling details. Internal laboratory tracking information must reference the  
15 laboratory identification number against the sample collection and laboratory delivery  
16 date and dates of sample extraction and analysis. The laboratory will provide both an  
17 electronic copy of the laboratory analytical summary report. The laboratory will also  
18 provide the data results in an electronic spreadsheet format to eliminate potential  
19 transcription errors. If electronic delivery cannot be completed, the laboratory data  
20 results will be entered into an electronic spreadsheet for manipulation and presentation  
21 of results in the final report. Electronic data files will be checked against the original  
22 laboratory reports for transcription/import errors. The laboratory will manage the original  
23 raw data from this project. A full data package with calibration checks, raw data, etc.,  
24 may be requested, if needed. Therefore, all raw data related to sample analysis must be  
25 retained by the laboratory for a minimum of ten years. The raw data shall be available  
26 upon request. The Laboratory Director is responsible for maintaining and retaining the  
27 laboratory records.

### 28 **Data Manipulation and Retention**

29 Field and laboratory data will be reviewed for accuracy, verified, and validated per the  
30 procedures outlined in Section D. Upon receipt of laboratory data, the data is reviewed  
31 for its usability. Upon this determination, data is then formatted into tables and  
32 compared to regulatory limits to determine if contamination is present at the subject  
33 property. Most laboratories (defined in the Site-specific QAPP Addenda) provide their  
34 data in formatted tables directly from their Laboratory Information Management System  
35 (LIMS); this lessens the required manipulation of data and, therefore, provides a more  
36 accurate presentation of data. Upon completion of formatting the Analytical Data Table;  
37 data is reviewed for accuracy by the QA/QC Manager. An appropriate summary will be  
38 included in the final project report along with the data tables summarizing the collected  
39 data. Copies of the field data sheets, boring logs, chain of custody forms, and the  
40 laboratory summary package will be included as appendices to the final report.

41 All field records and the laboratory summary report will be stored in the project file  
42 located at the Project Manager's office. All paper files are retained at the Cardno office  
43 in Columbia, South Carolina, for a minimum of five (5) years after project closeout. In an  
44 effort to be a more environmentally-sensitive company, Cardno minimizes its use of  
45 paper copies of reports (when applicable) by generating digital reports, data files, and

1 other documents for use by the client, although paper report copies are always available  
2 upon request. All digital copies of Cardno reports and documents are also maintained on  
3 the company network and in the project folder. Electronic files are backed up nightly and  
4 stored on an off-site server.

## 5 **C1. ASSESSMENT AND RESPONSE ACTIONS**

6 Assessments are planned to include potential audits of field activities, the verification  
7 and validation of all reported, data and QA review of all reports by senior level technical  
8 staff. The QA/QC Manager may conduct an on-site field audit at the time(s) when  
9 samples are being collected for both field and laboratory analysis. The QA/QC Manager  
10 will have the authority to halt the on-site work if he believes the findings from the audit  
11 justify such action. In the event discrepancies are identified during an audit, the QA/QC  
12 Manager will discuss findings with the Project Manager and Field Team Leader. The  
13 Field Team Leader, in consultation with the Project Manager, will be responsible for  
14 corrective actions related to field activities. Audit findings would be included in the Final  
15 Reports along with descriptions as warranted; this information is provided to the project  
16 staff, state, and EPA project personnel.

17 The Laboratory Director will be responsible for ensuring that laboratory activities are  
18 performed properly. Laboratory data will be reviewed for accuracy prior to reporting. Any  
19 discrepancies will be addressed internally per the laboratory QAM (to be included in the  
20 Site-specific QAPP Addenda) by the Laboratory Director. Significant issues that affect  
21 data usability will be discussed directly with the Project Manager at the time of  
22 discovery. Other quality control deviations will be noted as part of the laboratory QA/QC  
23 summary in the laboratory report. If necessary, samples will be reanalyzed or  
24 recollected and analyzed. The laboratory will provide a narrative report with the  
25 analytical results referencing the project, associated Chain of Custody, quality control  
26 issues, and the validity and integrity of the results. Section D2 of this QAPP discuss the  
27 verification and validation process in detail.

28 Routine corrective measures during all sampling activities will be taken at the discretion  
29 of the Field Team Leader. All corrective measures will be thoroughly documented in field  
30 logs. When issues are encountered and decisions on corrective actions are outside of  
31 Standard Operating Procedures (SOPs), the decision tree in **Figure 2** will provide  
32 guidance for the Field Team Leader to respond to field variances. The Project Manager  
33 and the Laboratory Director will be responsible for directing assessments and corrective  
34 actions and may issue stop work orders, if necessary. If a corrective action is  
35 implemented, the Project Manager or the Laboratory Director will verify that the  
36 corrective action was adequate and was properly documented. Non-conforming items  
37 found during field sampling and/or laboratory testing will be documented and corrected.  
38 Non-conformance reports will be completed and retained in the project file.

## 39 **C2. PROJECT REPORTS**

40 The Project Manager will prepare the final report, which will be reviewed for technical  
41 accuracy and data quality by the QA/QC Manager or similar senior technical staff (as  
42 appropriate). The final report will include a summary description of project activities, a  
43 summary of all data, the field activity report, a discussion on any problems encountered

1 during the project and the corrective actions taken, a discussion of the conclusions  
2 drawn from the results and the rationale for those conclusions, and the results of the  
3 data quality assessment. The report will include a site map showing the sample  
4 locations, copies of boring logs, tables identifying field measurements, including the  
5 elevations of borings and laboratory analytical reports. The tables will highlight any  
6 sample results exceeding criteria. Field records will be included in an attachment to the  
7 report. The report will be provided in both hard and electronic copy. When large  
8 amounts of data are included as attachments or appendices, an electronic copy on CD  
9 may be included instead in the hard copy report. Final reports will be forwarded to the  
10 EPA Project Manager as required. Laboratory analytical reports will be generated by the  
11 Laboratory Director and submitted to the Project Manager ten to fourteen calendar days  
12 after receipt of the samples. The Project Manager will then forward the analytical  
13 information to the NCDENR and EPA Project Managers in conjunction with the field  
14 notes.

15 The following listing summarizes types of reports and other documents that may be  
16 generated for this project:

- 17 • Quality Assurance Project Plans (QAPPs)
- 18 • Historical Phase I ESA
- 19 • Phase II ESA / Limited Site Assessment Report
- 20 • Interim Source Removal Proposal
- 21 • Interim Source Removal Report
- 22 • Site Rehabilitation Plan
- 23 • Site Assessment Report
- 24 • Risk Assessment Report
- 25 • No Further Action Proposal
- 26 • Natural Attenuation with Monitoring (MNA) Proposal
- 27 • Analysis of Brownfields Cleanup Alternatives (ABCAs)
- 28 • Remedial Action Plan (RAP)
- 29 • Remedial Action Status Report
- 30 • Notice of Residual Petroleum
- 31 • No Further Action Proposal with Monitoring Proposal
- 32 • No Further Action Proposal with Monitoring Report

33 Execution of proposed field activities for this project will commence with the approval of  
34 the Generic QAPP and the Site-specific QAPP Addenda.

## 35 **D1. FIELD DATA EVALUATION**

36 The Project Manager will oversee the field data collected and discuss any problems  
37 identified during the project with the Field Team Leader. Any problems and associated  
38 corrective actions will be documented in the field activity report. After the conclusion of  
39 field activities, the Project Manager will either complete or designate a team member  
40 independent of the field activities to complete the field data verification. The data  
41 verification will evaluate the completeness, correctness, and compliance of the data  
42 against the requirements and field sampling methods specified in the Site-specific QAPP  
43 Addenda. He will identify any potential issues and initiate corrective actions, if

1 appropriate. He will document the results of the data verification and provide the results  
2 to the data validator. The results will be stored in the project file.

3 The QA/QC Manager will be responsible for performing the data validation of the field  
4 data. **Table 7** provides a list of data validation activities. The validation process will  
5 include:

- 6 • Reviewing the field records and the results of the data verification;
- 7 • Identifying unacceptable data and initiating corrective actions; and
- 8 • Assigning data qualifiers, if necessary.

9 Data will be categorized as fully quantified, qualified, or unusable. Unusable data will not  
10 be utilized in the project decision process. The QA/QC Manager will provide a data  
11 validation report, including all calculations and the data with the appropriate qualifiers, to  
12 the Project Manager. The Project Manager must contact the NCDENR Project Manager  
13 and EPA Project Officer in the event that there are any deviations from the QAPP, and  
14 the NCDENR Project Manager and EPA Project Officer will determine if the data is  
15 acceptable or if re-sampling is required. If data that deviates from the QAPP is accepted,  
16 the data will be used for screening purposes only and the data will be annotated as  
17 such.

## 18 **D2. LABORATORY DATA EVALUATION**

19 The Laboratory Director will review and verify the laboratory data generated under their  
20 corrective action system for accuracy according to the laboratory's Quality Assurance  
21 System. Quality control checks are performed on field data by reviewing the chain of  
22 custody forms and results from the lab for each sampling event. All sample results will  
23 be reviewed and correlated to field measurements and observations. **Table 7** provides a  
24 list of data validation activities. The validation process will include:

- 25 • Reviewing the laboratory summary package and the results of the data  
26 verification;
- 27 • Identifying unacceptable data and initiating corrective actions;
- 28 • Assigning data qualifiers, if necessary.

29 In addition to evaluating data qualifiers associated with laboratory analyses, the Project  
30 Manager will evaluate the reproducibility of the sample results by performing a  
31 comparison of the sample duplicate(s) and the corresponding sample result(s). For this  
32 comparison, if the duplicate or sample result is less than five (5) times the reporting limit  
33 (the higher of the two if they are not the same for each, which they almost always are),  
34 then the comparison is made by the absolute difference between the results (Sample -  
35 Duplicate). For water samples, if this difference is less than the magnitude of the  
36 (higher) reporting limit, precision is considered "acceptable." For soil samples, if the  
37 difference is less than twice the magnitude of the (higher) reporting limit, precision is  
38 considered "acceptable." If these differences are within two (2) times the "acceptable"  
39 limits, they are considered "slightly high" (anything beyond that would be considered  
40 "high"). If both sample and duplicate results are greater than five (5) times the reporting  
41 limit (the higher of the two RLs, if they are not the same), then precision is assessed by  
42 the %RPD (difference in results divided by the average of the two results X 100). <35%

1 RPD = “good/acceptable”, >35% but < 50% = variability is “slightly high”, >50% = “high”.

2 Precision, accuracy, and completeness calculations are as follows, respectively:

3 1.  $RPD = 200 * [(BS \%R - BSD \text{ Result}) / (BS \%R + BSD \text{ Result})]$

4 2.  $BS \text{ Recovery} = 100 * (BS \text{ Result}) / [\text{Spike Added}]$

5 3.  $BSD \text{ Recovery} = 100 * (BSD \text{ Result}) / [\text{Spike Added}]$

6 Where:

7 RPD: Relative Percent Difference

BS: Blank Spike

8 %R: Percent Recovery

BSD: Blank Spike Duplicate

9 Based on the data qualifiers provided by the laboratory and on the sample/sample  
10 duplicate comparison described above, data will be categorized as fully quantified,  
11 qualified, or unusable. Unusable data will not be utilized in the project decision process.  
12 Raw data will be included in all submitted project reports.

13 An evaluation of laboratory analysis procedures and review of: holding times, blanks,  
14 control samples, duplicate analysis, detection limits, holding times, laboratory controls,  
15 and overall assessment of data will be conducted.

16 The data usability will compare proposed sample locations to actual sample locations.  
17 The review also will verify that the predefined number of samples were analyzed and  
18 will confirm that the predefined analytical methods and detection limits were used. The  
19 Project Manager will review the quality control samples, hold times, calibration,  
20 surrogate recovery, as well as the precision and accuracy data for the sampled analytes  
21 of concern to determine whether the data will be accepted or rejected. In the event  
22 results are rejected, the QA/QC Manager, Project Manager, EPA Project Officer, and  
23 NCDENR Project Manager will meet (via conference call) to discuss the reasons for the  
24 rejection of data and what steps should be initiated including additional site sampling if  
25 deemed necessary. Problems associated with the laboratory will be documented in the  
26 laboratory QA report provided with all analytical results, which will be provided to all end  
27 users in the form of summary reports.

### 28 **D3. DATA USABILITY AND PROJECT VERIFICATION**

29 The Laboratory Director will review and verify the laboratory data generated under their  
30 corrective action system for accuracy according to the laboratory's Quality Assurance  
31 System. Any problems identified during this process will be reported to the Project  
32 Manager in the analytical data report. Information on QC criteria will be included in the  
33 Site-Specific QAPP Addendum. The QA/QC Manager along with the Project Manager  
34 validates laboratory data upon receipt of the analytical results.

35 The Laboratory Director/QA Manager will evaluate the sample/sample duplicate data  
36 and equipment blank data to determine if data precision is of an acceptable quality.  
37 Pending these three data validation procedures, the data will be determined to be of a  
38 specified quality and reported as such. For instance, data will typically be reported with  
39 no qualifiers if the data are determined to be fully useable. However, a discussion of  
40 data limitations will be added to the data summary tables and data discussion within the  
41 reports if data validity is compromised in anyway.

1 When applicable, the Project Manager will also review and verify the field sheets, the  
2 final report, and the analytical data report. Any problems or deviations will be  
3 documented in the field activity report. The Project Manager will discuss any problems  
4 along with proposed corrective actions with the QA/QC Manager.

5 Valid data of known and documented quality is required for all media sampled. Once  
6 reliable and representative data are obtained, the data will be compared to the targeted  
7 cleanup levels to determine if no further action is required or if active remediation is  
8 needed. The Project Manager will reconcile the data with the project-specific objectives.

9 The process for reconciling the data includes the evaluation of the following questions:

- 10 1) Were samples collected using the appropriate collection procedures?
- 11 2) Were samples handled in accordance with the SOPs?
- 12 3) Were the samples collected from the pre-determined or specific sampling  
13 locations?
- 14 4) Were the samples properly preserved?
- 15 5) Were field sampling problems documented in field logs?
- 16 6) Were the QAPP-specified analytical methods used?
- 17 7) Were problems identified during laboratory analysis?
- 18 8) Was the laboratory able to meet the MDLs, PQLs, and QA/QC  
19 requirements specified in the QAPP or provided in the analytical methods?
- 20 9) What were the results of data validation - do any of the data points require  
21 rejection?
- 22 10) If data is problematic, is re-sampling or reanalysis required (if data is  
23 rejected - how does the result affect the ability to make site decisions)?

24 Because data generated with significant deviations from the requirements of the QAPP  
25 will be rejected and because of the nature of the work (biased sampling), all data will  
26 have the same expected uncertainties and there will be no limitations on data use.  
27 **Table 8** provides a list of data usability assessment activities.

28 Field modifications regarding sampling analysis may be necessary for circumstances  
29 such as auger refusal, limited access areas or when enough sample volume could not  
30 be collected for various reasons. Re-sampling may be necessary if results are deemed  
31 unacceptable for various reasons such as exceeding laboratory holding times, etc.  
32 These variables will be further defined in the Site-Specific QAPP Addendum when the  
33 project description is detailed based on the specific COCs.

## Tables

**Table 1: Documents and Records**

| <b>Type of Document or Record</b> | <b>Purpose of Document or Record</b>   |
|-----------------------------------|--|
| Boring log                        | Maintains accurate record of field soil sampling activities by providing written notes of all activities. An example boring log is included in Attachment B.                                 |
| Field Data Sheet                  | Maintains accurate record of groundwater sampling activities by providing written notes of all activities. An example field data sheet is included in Attachment B.                          |
| Chain of custody form             | Maintains proof that samples were not tampered with and that samples were under the appropriate possession at all times. An example blank chain of custody form is included in Attachment B. |
| Instrument calibration records    | Maintains accurate record of instrument calibration.   |
| Sample location survey            | Records all sample locations so they can be accurately plotted on a map.   |
| Photo logs                        | Maintains accurate record of photo documentation   |
| Laboratory data report            | Documents the results of the laboratory analyses. Refer to the “Laboratory Data Deliverables” subsection under Section A8 for more details.  |
| Data verification checklist       | Provides staff a minimum set of questions to consider during the data verification process and documents the results of data verification.   |
| Data validation checklist         | Provides staff a minimum set of questions to consider during the data validation process and documents the results of the data validation.   |
| Final assessment report           | Documents the field activities, the laboratory analyses, the results, and the conclusions of the environmental site assessment.  |

**Table 2: Quality Control Data Provided by Laboratory**

The following information by matrix (soil, ground water, surface water, sediment, etc.) and laboratory test (8260B, 8270C, 8082, etc.) will be provided by the laboratory in the project analytical report and analytical report narrative

| <b>Quality Control Results</b>           | <b>Information Provided by Laboratory</b>  |
|--|--|
| <b><i>General Sample Information</i></b> | Date sample collected  |
|  | Date sample received at lab  |
|  | Sample ID versus laboratory sample number  |
|  | Condition of samples and temperature   |
|  | Date sample analyzed   |
|  | Dilution factor  |
|  | Analysts   |
| <b><i>Hold Time</i></b>                  | The samples were analyzed within the method required hold times with any exceptions noted in the narrative   |
| <b><i>Sample Preparation</i></b>         | The samples were prepared in accordance with sample preparation method (EPA 5035, EPA 3010, EPA 7470, etc.) with any exceptions noted in the narrative |
| <b><i>Initial Calibration</i></b>        | All criteria were within method requirements with any exceptions noted in the narrative  |
| <b><i>Continuing Calibration</i></b>     | All criteria were within method requirements with any exceptions noted in the narrative  |
| <b><i>Surrogates</i></b>                 | All surrogates were within QC limits with any exceptions noted in the narrative  |
| <b><i>Method Blank</i></b>               | All analytes were below the report limit in the method blank with any exceptions noted in the narrative  |
| <b><i>Laboratory Control Spike</i></b>   | All laboratory control spike compounds were within QC limits with any exceptions noted in the narrative  |
| <b><i>Matrix Spike</i></b>               | All percent recoveries and relative percent differences (RPDs) were within acceptance criteria with any exceptions noted in the narrative              |
| <b><i>Duplicate Samples</i></b>          | All duplicate sample results were within method acceptance criteria with any exceptions noted in the narrative   |

**Table 3: Sample Containers, Volumes, Preservation, and Holding Times**

| <b>Matrix</b>         | <b>Parameter</b><br>Prep, digestion or extraction method(s) given first followed by analytical method(s)                                 | <b>Minimum Sample Volume<sup>1</sup></b> | <b>Sample Container<sup>2</sup></b>                             | <b>Preservation Method</b>                                   | <b>Holding Times</b>                      |
|-----------------------|--|--|---|--|---|

<sup>1</sup> Triple volume is required for matrix spike/matrix spike duplicate (MS/MSD) analysis

<sup>2</sup> Sample bottles must comply with US EPA, December 1992, Specifications and Guidance for Contaminant-Free Sample Containers: OSWER Directive 9240.0-05A, EPA 540/R-93/051, Office of Solid Waste and Emergency Response, Washington, DC. All sample containers will be provided by the laboratory.

<sup>3</sup> Sodium thiosulfate should only be used in the presence of residual chlorine

<sup>4</sup> Zinc Acetate used to remove the presence of residual chlorine

<sup>5</sup> Maximum holding time is 24 hours when sulfide is present

**Table 4: Field Quality Control Requirements**

| <b>QC Sample</b>         | <b>Frequency</b>  | <b>Acceptance Criteria</b>  | <b>Corrective Action</b>  |
|--------------------------|---|-----------------------------|---|
| Field Duplicate          | One per 20 samples per matrix or one per day, whichever is more frequent  | ± 15 %                      | Qualify data as appropriate based on precision                            |
| Split Sample             | 10 % of field screening data will be confirmed with data from a fixed laboratory                                      | ± 15 %                      | Qualify data as appropriate based on accuracy and precision               |
| Equipment Rinsate Blank  | One per 20 samples per matrix per equipment type per decontamination event or one per day, whichever is more frequent | No target analytes in blank | Qualify data based on potential of equipment cross contamination          |
| Field Blank              | One per 20 samples per matrix or one per day, whichever is more frequent  | No target analytes in blank | Qualify data based on potential cross contamination from field conditions |
| VOC Trip Blank           | One for each cooler that which contains samples for VOC analysis  | No target analytes in blank | Qualify data for field or laboratory contamination                        |
| Cooler Temperature Blank | One per cooler  | ± 2 °C                      | Qualify data as appropriate by type of analysis                           |

**Table 5: Preventive Maintenance of Common Field Equipment**

| Instrument  | Activity  | Frequency  |
|---|---|--|
| Water Level Indicator (Solinst Model 101 ) and Interface (Product) Probe (Solinst Model 122)                              | <ul style="list-style-type: none"> <li>• Check batteries and self-test</li> <li>• Check and clean probe tip</li> </ul>  | Prior to each field event                              |
| Photoionization (Photovac MicroFID) and Flame Ionization Detectors (Rae-Minirae 2000) (PIDs/FIDs)                         | <ul style="list-style-type: none"> <li>• Check batteries and charge</li> <li>• Check with calibration gas</li> <li>• Check lamp and operation</li> </ul>                                | Prior to each field event                              |
|   | <ul style="list-style-type: none"> <li>• Periodic maintenance</li> </ul>  | Per manufacturer's recommendation (typically annually) |
| pH Meter (YSI pH100) State Certified (#5484)  | <ul style="list-style-type: none"> <li>• Check for low battery indication</li> <li>• Calibrate with known pH standards</li> </ul>   | Daily  |
| Specific Conductivity Meter (YSI63)   | <ul style="list-style-type: none"> <li>• Check batteries and self-test</li> <li>• Check with calibration standard</li> </ul>  | Daily  |
| pH, Specific Conductivity, Dissolved Oxygen, Turbidity and Temperature and Other Multiple Function Meters (Horiba U-22XD) | <ul style="list-style-type: none"> <li>• Check batteries and operations</li> <li>• Check standards and buffers</li> <li>• Check outputs against normal ranges for parameters</li> </ul> | Prior to each field event                              |

**Table 6: Calibration and Corrective Action for Common Field Equipment**

| Instrument  | Calibration Standard                                 | Calibration Frequency   | Acceptance Criteria | Corrective Action  |
|---|--|---|---------------------|--|
| <b>Photoionization and Flame Ionization Detectors (PIDs/FIDs)</b>                     | Calibration gas (Typically 100 ppm isobutylene)      | Daily   | ± 5 %               | <ol style="list-style-type: none"> <li>1. Adjust instrument, check charge, recalibrate</li> <li>2. Note calibration issues and flag field data as necessary</li> <li>3. Send unit for servicing</li> <li>4. Rent/retrieve replacement unit if necessary</li> </ol>   |
| <b>pH Meter</b>   | pH Standards (4, 7, and 10 typical)                  | Prior to use in the field, at least every four hours, and any time the unit has been turned off with correction for temperature of samples as needed* | ± 10 %              | <ol style="list-style-type: none"> <li>1. Adjust instrument, check battery, recalibrate</li> <li>2. Perform occasional operational checks to see if site conditions have affected electronics. Recalibrate if necessary.</li> <li>3. Note calibration issues and flag field data as necessary</li> <li>4. Send unit for servicing</li> <li>5. Rent/retrieve replacement unit if necessary</li> <li>6. Use pH paper as back up</li> </ol>       |
| <b>Specific Conductivity Meter</b>  | Calibration with manufacturer's recommended standard | Prior to use in the field with correction for temperature of samples as needed*   | ± 10 %              | <ol style="list-style-type: none"> <li>1. Adjust instrument, check charge, recalibrate</li> <li>2. Calibration sensitive to temperature change. Take temperature of sample, and correct instruments temperature adjustment to temperature of sample (if required).</li> <li>3. Note calibration issues and flag field data as necessary</li> <li>4. Send unit for servicing</li> <li>5. Rent/retrieve replacement unit if necessary</li> </ol> |
| <b>Multiple Function Meters (pH, Sp. Cond. DO, Temperature, ORP, Turbidity, etc.)</b> | Calibration with manufacturer's recommended standard | Prior to use in the field with correction for temperature of samples as needed*   | ± 10 %              | <ol style="list-style-type: none"> <li>1. Adjust instrument, check charge, recalibrate</li> <li>2. Calibration sensitive to temperature change. Take temperature of sample, and correct instruments temperature adjustment to temperature of sample (if required).</li> <li>3. Note calibration issues and flag field data as necessary</li> <li>4. Send unit for servicing</li> <li>5. Rent/retrieve replacement unit if necessary</li> </ol> |
| <b>Water Level Indicator / Interface (Product) Probe</b>                              | Surveyor's Steel or Fiberglass Tape                  | Quarterly   | ± 0.05 %            | <ol style="list-style-type: none"> <li>1. Measure indicator/probe cable against surveyor's tape</li> <li>2. Note calibration issues and flag field data as necessary</li> <li>3. Send unit for replacement cable</li> </ol>  |

\* A post-operation instrument verification check should be performed at the end of the day or after all measurements have been taken for a particular period of operation

**Table 7: Data Validation Activities**

| Item                                     | Activity  |
|--|---|
| <b>Data Deliverables and QAPP</b>        | Ensure that all required information on sampling and analysis was provided (including planning documents).  |
| <b>Analytes</b>                          | Ensure that required lists of analytes were reported as specified.  |
| <b>Chain-of-Custody</b>                  | Examine the traceability of the data from time of sample collection until reporting of data. Examine chain-of-custody records against contract, method, or procedural requirements.   |
| <b>Holding Times</b>                     | Identify holding time criteria, and either confirm that they were met or document any deviations. Ensure that samples were analyzed within holding times specified in method, procedure, or contract requirements. If holding times were not met, confirm that deviations were documented, that appropriate notifications were made (consistent with procedural requirements), and that approval to proceed was received prior to analysis. |
| <b>Sample Handling</b>                   | Ensure that required sample handling, receipt, and storage procedures were followed, and that any deviations were documented.   |
| <b>Sampling Methods and Procedures</b>   | Establish that required sampling methods were used and that any deviations were noted. Ensure that the sampling procedures and field measurements met performance criteria and that any deviations were documented.   |
| <b>Analytical Methods and Procedures</b> | Establish that required analytical methods were used and that any deviations were noted. Ensure that the QC samples met performance criteria and that any deviations were documented.   |
| <b>Data Qualifiers</b>                   | Determine that the laboratory data qualifiers were defined and applied as specified in methods, procedures, or contracts.   |
| <b>Deviations</b>                        | Determine the impacts of any deviations from sampling or analytical methods and SOPs. Consider the effectiveness and appropriateness of any corrective action.  |
| <b>Sampling Plan</b>                     | Determine whether the sampling plan was executed as specified (i.e., the number, location, and type of field samples were collected and analyzed as specified in the QAPP).   |
| <b>Sampling Procedures</b>               | Evaluate whether sampling procedures were followed with respect to equipment and proper sampling support (e.g., techniques, equipment, decontamination, volume, temperature, preservatives, etc.).  |
| <b>Co-located Field Duplicates</b>       | Compare results of collocated field duplicates with criteria established in the QAPP.   |
| <b>Project Quantitation Limits</b>       | Determine that quantitation limits were achieved, as outlined in the QAPP and that the laboratory successfully analyzed a standard at the QL.   |
| <b>Confirmatory Analyses</b>             | Evaluate agreement of laboratory results.   |
| <b>Performance Criteria</b>              | Evaluate QC data against project-specific performance criteria in the QAPP (i.e., evaluate quality parameters beyond those outlined in the methods).  |
| <b>Data Qualifiers</b>                   | Determine that the data qualifiers applied were those specified in the QAPP and that any deviations from specifications were justified.   |
| <b>Validation Report</b>                 | Summarize deviations from methods, procedures, or contracts. Include qualified data and explanation of all data qualifiers.   |

**Table 8: Data Usability Assessment**

| Item   | Assessment Activity   |
|--|---|
| <b>Data Deliverables and QAPP</b>              | Ensure that all necessary information was provided, including but not limited to validation results.  |
| <b>Deviations</b>                              | Determine the impact of deviations on the usability of data.  |
| <b>Sampling Locations, Deviation</b>           | Determine if alterations to sample locations continue to satisfy the project objectives.  |
| <b>Chain-of-Custody, Deviation</b>             | Establish that any problems with documentation or custody procedures do not prevent the data from being used for the intended purpose.  |
| <b>Holding Times, Deviation</b>                | Determine the acceptability of data where holding times were exceeded.  |
| <b>Damaged Samples, Deviation</b>              | Determine whether the data from damaged samples are usable. If the data cannot be used, determine whether resampling is necessary.  |
| <b>PT Sample Results, Deviation</b>            | Determine the implications of any unacceptable analytes (as identified by the PT sample results) on the usability of the analytical results. Describe any limitations on the data.  |
| <b>SOPs and Methods, Deviation</b>             | Evaluate the impact of deviations from SOPs and specified methods on data quality.  |
| <b>QC Samples</b>                              | Evaluate the implications of unacceptable QC sample results on the data usability for the associated samples. For example, consider the effects of observed blank contamination.  |
| <b>Matrix</b>                                  | Evaluate matrix effects (interference or bias).   |
| <b>Meteorological Data and Site Conditions</b> | Evaluate the possible effects of meteorological (e.g., wind, rain, temperature) and site conditions on sample results. Review field reports to identify whether any unusual conditions were present and how the sampling plan was executed.   |
| <b>Comparability</b>                           | Ensure that results from different data collection activities achieve an acceptable level of agreement.   |
| <b>Completeness</b>                            | Evaluate the impact of missing information. Ensure that enough information was obtained for the data to be usable (completeness as defined in PQOs documented in the QAPP).   |
| <b>Background</b>                              | Determine if background levels have been adequately established (if appropriate).   |
| <b>Critical Samples</b>                        | Establish that critical samples and critical target analytes/COCs, as defined in the QAPP, were collected and analyzed. Determine if the results meet criteria specified in the QAPP.   |
| <b>Data Restrictions</b>                       | Describe the exact process for handling data that do not meet PQOs (i.e., when measurement performance criteria are not met). Depending on how those data will be used, specify the restrictions on use of those data for environmental decision-making.                                |
| <b>Usability Decision</b>                      | Determine if the data can be used to make a specific decision considering the implications of all deviations and corrective actions   |
| <b>Usability Report</b>                        | Discuss and compare overall precision, accuracy/bias, representativeness, comparability, completeness, and sensitivity for each matrix, analytical group, and concentration level. Describe limitations on the use of project data if criteria for data quality indicators are not met. |
