SUBJ: EPA and NCDENR Comments on the Removal Action Completion Report
For the VCC Winston-Salem Site, Winston-Salem, North Carolina

Dear Mr. Pelton:

I have reviewed the Removal Action Completion Report for the VCC Winston-Salem site in Winston-Salem, North Carolina, and have the following comments. Also attached to this email is a file with comments from NCDENR. Please provide a response to these comments.

Section 3 states that Institutional Controls (ICs) will be implemented and annual inspections will be made. I recommend that ExxonMobil, ARCADIS, EPA, and NCDENR have a conference call in the near future to discuss which type(s) of property-use limitations/restrictions are appropriate for the Site (i.e., future land use restrictions, future groundwater use restrictions, etc.), how and when the ICs will be implemented, and how the annual inspections will be conducted and reported to EPA and NCDENR. Once these decisions are made, I'd like to see a more-detailed description either provided in the Removal Action Completion Report, or described in a separate Post-Removal Site Control Plan.

If you have any questions, please feel to call me at 404-562-8802.

Sincerely,

A handwritten signature in cursive script that reads "McKenzie Mallary".

RE: Removal Action Completion Report
Former Virginia-Carolina Chemical Company Winston-Salem Site
Winton-Salem, Forsyth County, North Carolina

Dear Mr. Mallary:

The North Carolina Department of Environment and Natural Resources (NC DENR) Superfund Section has received the *Removal Action Completion Report* for the Former Virginia-Carolina Chemical Company Winston-Salem Site. The NC DENR Superfund Section has reviewed this document and offers the following attached comments.

The NC DENR Superfund Section appreciates the opportunity to comment on this document. If you have any questions or comments, please feel free to contact me at (919) 508-8466 or at david.mattison@ncdenr.gov.

Sincerely,

David B. Mattison
Environmental Engineer
NC DENR Superfund Section

Attachment

Removal Action Completion Report Former Virginia-Carolina Chemical Company Winston-Salem Site

Section 1.3 Report Organization

1. Please revise the first paragraph of Section 1.3 to correctly describe the contents of the *Removal Action Completion Report*.
2. Please revise the first bullet item of the second paragraph of Section 1.3 to state that "Appendix A contains photographs taken before, during and after the soil removal action..."

Section 2.4 Soil Removal Activities

3. Please supplement Section 2.4 with a separate appendix containing an electronic scanned copy of the field notes documenting the soil removal activities.

Section 2.4.7 Soil Stabilization and Stockpiling

4. Please revise the first paragraph of Section 2.4.7 to indicate that the purpose of soil stabilization activities was to also reduce the leachable concentrations of arsenic to less than 5 milligrams per liter (mg/L).
5. Please supplement Section 2.4.7 with a figure depicting those areas requiring stabilization prior to transportation and disposal.
6. Please revise the second paragraph of Section 2.4.7 to more completely describe Enviroblend and the mixture ratios required to achieve stabilization.

Section 2.4.8 Dust Monitoring Program

7. Please provide additional details regarding the implementation of the dust monitoring program (i.e., how many, how frequent, duration of sampling, where located, warning alarms, etc.)
8. Please supplement Section 2.4.8 with a section describing the health and safety program and its implementation.

Section 2.4.9 Water Management

9. Please append Section 2.4.9 with a description of how the stormwater was managed when the water did come in contact with contaminated soils.

Section 2.5.1 Confirmation Sampling

10. Please supplement the third paragraph of this section with a figure depicting those impacted soils that were left in place and all X-ray fluorescence (XRF) field screening results and confirmation soil sample analytical results.

Section 2.5.2 Waste Stabilization Stockpile Sampling

11. Please revise the second paragraph of Section 2.5.2 to include a description of the location of the area represented by the stockpile described in this paragraph (i.e., grid number, etc).

Section 2.5.3 Backfill Material Sampling Activities

12. Please revise the fourth sentence of Section 2.5.3 to state "The fill materials were approved for use by both USEPA and NCDENR."

Section 2.6 Site Restoration

13. Please supplement the second bullet item of Section 2.6 with figures depicting both pre-excavation and post-excavation topographical surveys.

Section 4 Groundwater

14. Please revise Section 4 to include provisions for a more robust assessment of groundwater at the Site.

Table 2-1 Summary of Confirmation Soil Sample Analytical Results

15. Please supplement Table 2-1 with a separate appendix containing an electronic scanned copy of the laboratory analytical results summarized in Table 2-1.
16. Please supplement Table 2-1 with a separate figure depicting the locations where the confirmation soil samples were located (i.e., specific locations for discrete samples and areas used for composite samples).

Table 2-2 Summary of Soil Stabilization Sample Analytical Results

17. Please supplement Table 2-1 with a separate appendix containing an electronic scanned copy of the laboratory analytical results summarized in Table 2-2.

Figure 2-1A Site Plan Showing Limits of Soil Removal – North of Highway 52/SR-8

18. Please revise Figure 2-1A to include the depths of excavation for each area.

Figure 2-1B Site Plan Showing Limits of Soil Removal – South of Highway 52/SR-8

19. Please revise Figure 2-1B to include the depths of excavation for each area.

Appendix B Soil Disposal Log

20. Please supplement Appendix B with an electronic scanned copy of the Waste Manifests summarized in the table included as Appendix B.

Appendix C Air Monitoring Results

21. Please supplement Appendix C with an electronic scanned copy of the laboratory analytical results summarized in the table included as Appendix C.

Subject:
Former VCC Winston-Salem Site: Removal Action Completion Report
Winston-Salem, North Carolina

Dear Mr. Mallary:

Please find enclosed for your review three (3) copies of the *Removal Action Completion Report (RACR)* for the Former VCC Winston-Salem Site (Site) located in Winston-Salem, Forsyth County, North Carolina. This RACR has been prepared by ARCADIS U.S., Inc. (ARCADIS) on behalf of ExxonMobil Environmental Services Company (EMES) to document soil removal activities conducted at the Site. If you have any questions, please feel free to call me or Steve Schmidt of EMES at 703.846.1005.

Sincerely,

ARCADIS

Bruce Parris
Environmental Supervisor II, Western Region
North Carolina Department of Environment and Natural Resources
Division of Waste Management- Inactive Hazardous Sites Branch
Mooresville Regional Office
610 East Center Street, Suite 301
Mooresville, NC 28115

Subject: NCDOT Bridge Replace Project on US 52 at Liberty Street in Winston Salem, Forsyth County and Contaminated Soil Related to the former Virginia Carolina Chemical and Carolina Ore Facilities

Dear Mr. Parris:

As you are aware, NCDOT is currently in the process of replacing the bridge on US 52 over Liberty Street and the NSRR tracks in Forsyth County. The project right-of-way crosses property that is known as the former Virginia Carolina Chemical (VCC) and Carolina Ore properties. The property is currently owned by Waste Management, Atlantic Scrap and Processing, and the NCDOT. ExxonMobil is the responsible party for the arsenic and lead contaminated soil related to the former VCC facility. Pursuant to an agreement between USEPA and ExxonMobil with oversight by the Federal Remediation Branch of the North Carolina Super Fund Section, ExxonMobil has been performing a voluntary soil removal action. Also, pursuant to an agreement between ExxonMobil and NCDOT, ExxonMobil has removed contaminated soil from the newly acquired right of way on this active construction project.

Recently, while excavating for their voluntary removal action, ExxonMobil discovered contamination that it believes is not their responsibility. Testing performed jointly by our consultant, Hart and Hickman, and personnel from the Inactive Hazardous Sites Branch, has been completed in this area. The results show levels of arsenic and lead that are above worker safety levels. The in situ contaminated soil have magenta coloration and is contiguous to the area recently excavated by ExxonMobil's contractor. It is our desire that this contaminated soil be removed prior to the construction of this project, however in conversations with USEPA and your Division; it is evident that there are questions as to who should be responsible for this contaminated soil.

MAILING ADDRESS:
NC DEPARTMENT OF TRANSPORTATION

LOCATION:
CENTURY CENTER COMPLEX
BUILDING B
1020 BIRCH RIDGE DRIVE
RALEIGH NC 27610

In order for our construction to continue in a timely manner, NCDOT plans to safely cover the contaminated soils within the construction limits of the project with a minimum of twelve (12) inches of clean soil to protect the construction workers and prevent surface runoff from entering Bowen Branch and its tributaries. This work will be conducted by Hart and Hickman and their subcontractor EVO, who are both well versed in handling contaminated materials. They will clear the construction limits of vegetation leaving the larger root balls in place to minimize soil disturbance, cover the area with a visual marker to warn workers in the event that any future excavations are performed in the area, and place a minimum of twelve (12) inches of clean soil over the contaminated soil. The concrete foundations of the former Carolina Ore facility in the construction area will be removed to approximately twelve (12) inches below the existing ground surface and will also be covered with a minimum of twelve (12) inches of clean fill material over the existing grade. Once the clean soil is in place, construction will resume in this area. The contaminated area will also be documented in the As-Built Construction Plans.

NCDOT is leaving the contaminated soil in situ, and will not discharge, deposit, transfer or arrange for the disposal of the contaminated soil. The vegetation cleared from the construction limits will be disposed of properly. NCDOT does not consider itself a responsible party or owner for purposes of liability of remedial actions relating to the contamination. By performing this work, NCDOT does not accept any liability for possible future remediation of the contamination. If in the future, remediation is required by the appropriate responsible party, NCDOT will allow the responsible party on to the NCDOT right of way by way of an encroachment agreement to perform any necessary remediation of the contamination.

We trust you understand our position in this matter. If there is any additional information we can provide in the future, please do not hesitate to call.

Sincerely,

Subject: Third Area of Magenta Soil Found-Former Carolina Ore Site
Attachments: CUT3 Magenta Soil Closeup 7-30-10.JPG; Distant View North CUT3 Magenta Soil With Carolina Ore in foreground.JPG

Matt and Cyrus:

In the process of trying to obtain coordinates this afternoon on the magenta soil areas, we found a third location where magenta soil is present on the area formerly occupied by Carolina Ore. Attached are two photographs showing this third location. We could not get our GPS Unit to work again this afternoon. We will get something else newer than the old GeoExplorer 2 and locate these points next week. Have a good weekend.

Bill:

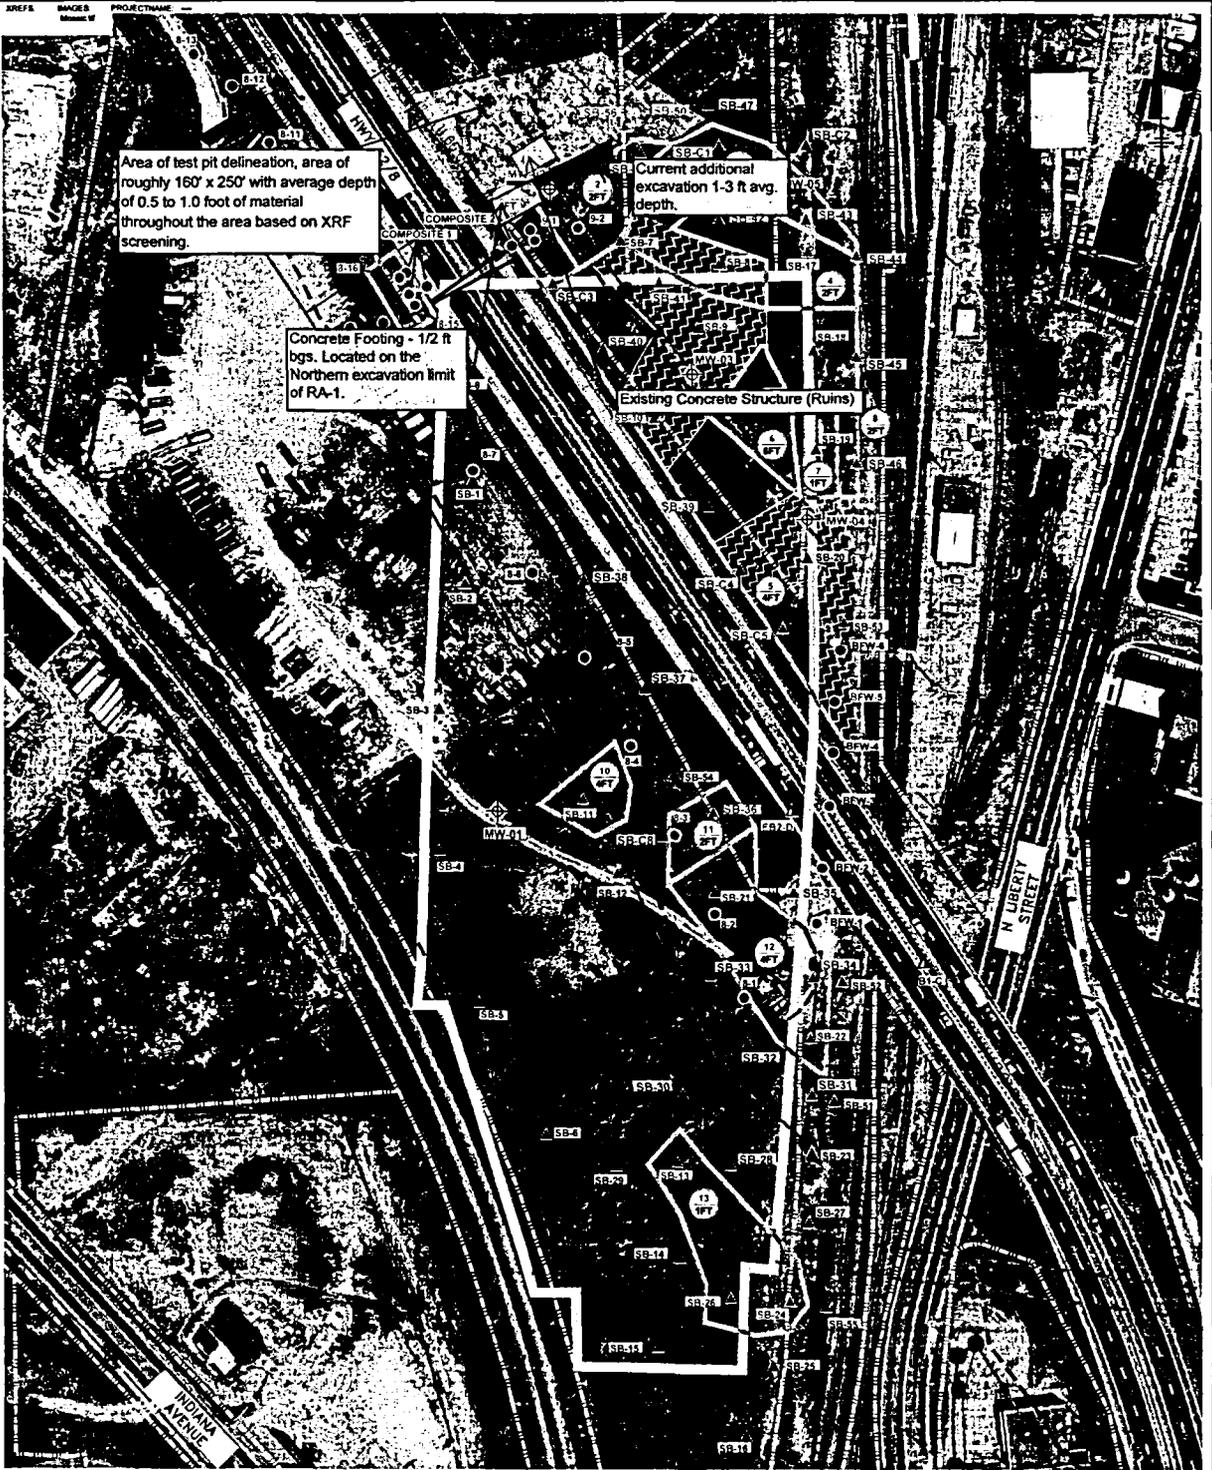

Attached is the impact area that ARCADIS estimates is present on the Carolina Ore Property. I am also attaching pictures of the magenta soil that appears to be located within the former Carolina Ore site boundaries. These pictures were taken this morning during our site visit and discussion with DOT personnel working in the area. We collected three soil samples this morning and are asking the NCDENR Division of Water Quality Lab to expedite the analysis of the samples for a quick turnaround.

Additionally, I am copying David Mattison on my message so that he is aware of what we have found at the site. I will phone him as well because we will need to discuss the developments and how they impact clean up in the area.

Subject: Additional Picture
Attachments: Magenta Soil North of Carolina Ore Ruins.JPG

Bill and Dave:

I failed to attach one picture that shows the location of the northernmost area of magenta soil in relation to the VC Chemical and Carolina Ore sites. I paced the area off and it is about 150 feet from the corner of the ruins in the woods. As my GPS unit was not functioning this morning, the DOT personnel with me indicated that their surveyor will be onsite either this afternoon or tomorrow and will provide a location for the material.

Subject: Winston-Salem Soil Removal Update

Ken/David – just wanted to let you know that Exxon’s soil removal activities at the Winston-Salem VCC site have been completed. All restoration outside of the DOT ROW has been completed and ENTACT/ARCADIS have demobilized from the site as of yesterday.

Wright – we understand Blythe is actively working on filling in the excavation areas on the north side of Highway 52. Please let us know if fill will extend above original grades around any of our monitoring wells in that area so that we can coordinate well modifications with their work. Otherwise, we’ve asked Blythe to protect the wells as they work around them to avoid any damage.

Please note I will be out on vacation starting this afternoon and will not return until August 11th. Please feel free to contact other team members as needed during this period if you have any questions. Thanks.

Matt

Subject: Deed Information
Attachments: Carolina Ore Property Deed Information.pdf

Dave:

The scanned copy came in pretty clear. It does show that while VC Chemical owned the property in 1903 they ended up selling a 3-acre tract to Carolina Ore in 1910. I checked the 1912 Sanborn map and it does show a 35-inch pipe from the VC facility. The pipe exits out the extreme northern portion near the acid chamber and runs north towards Bowen Branch. The map notes state that the pipe does run to the creek, although they do not state the name of the creek. The pipe, therefore, evidently, just ran across Carolina Ore property having been installed prior to the sale. Hence, it really has no relevance concerning the matter before us. Have a good one.

1893 - 1927

Virginia Carolina Chem. owned property that they sold to Carolina Ore Co.

As will be seen from the above analyses, there is considerable variation in the metallic contents of the ore, but the iron content is good, and as they are all comparatively low in sulphur, phosphorus, and titanium, they will, therefore, make iron ores of high value.

Analyses I and II of ore from the Calloway property are low in iron, but they represent samples taken across the full width of the ore deposit, including gangue and waste. By hand cobbing this ore can readily be raised to a 55 to 60 per cent iron ore. The magnetite portion of the vein gives as high as 65 per cent metallic iron.

The ores represented by analyses III, IV, and VIII-A can also be easily concentrated by hand cobbing.

All the ores tested are a splendid grade of magnetite, and should make a pig iron of exceptional quality.

1911-12 Article

WATAUGA COUNTY IRON ORE.

About 7 miles southeast of Boone, Watauga County, and near Cook's Gap, there is an iron ore deposit known as the "Bull Ruffin." The ore is a magnetite, which is very pure, of rather schistose structure, with small octahedral crystals disseminated through it. This ore body is now attracting some attention on account of the construction of the Watauga and Yadkin River Railroad, which will pass near this property, and it is now being developed to determine something accurate about the quantity of ore that the deposit will contain.

A company known as "The Carolina Ore Company" of WinstonSalem was recently organized for the purpose of converting the refuse from a sulphuric acid plant into ore briquettes or nodules, which can be shipped to the iron furnace in Virginia. This company has made contracts with a number of other plants for their iron oxide refuse, with which they will make iron ore. In the manufacture of sulphuric acid from pyrite, if the ore is thoroughly roasted so that the sulphur is nearly completely driven off, the refuse, which is an iron oxide, will make a good ore of iron. In many instances the distance of transportation of this material to a blast furnace has prevented its being used as a source of iron.

PRODUCTION.

In 1911 and 1912 the production of iron ore for North Carolina was obtained entirely from the Cranberry Mine of Avery County. In 1911 this amounted to 84,782 long tons, valued at \$148,369; in 1912, to 68,322 long tons, valued at \$186,264.

There is given in the table below the production and value of iron ore for North Carolina from 1900 to 1912, inclusive:

Subject:
Removal Site Evaluation Report
VCC Site - Charlotte, North Carolina

Dear Mr. Zeller:

Enclosed for your review are three (3) copies of the Removal Site Evaluation Report for the former Virginia-Carolina Chemical Corporation Site located in Charlotte, North Carolina. This report was prepared by ARCADIS G&M of North Carolina, Inc. on behalf of Exxon Mobil Environmental Services (EMES). If you have any questions or concerns, please feel free to call me or Steven Schmidt of EMES at 703-846-1005.

Sincerely,

ARCADIS G&M of North Carolina, Inc.

Matthew Pelton, P.E.
Senior Environmental Engineer

Documentation of Site 31FY1160**,
Proposed Improvements to US 52 from I-40 Bypass
to NC 65, Winston-Salem, Forsyth County

NCDOT TIP U-2826B; Federal Aid No. NHF-52(4);
ER # 05-0934

By Caleb Smith

N.C. Department of Transportation,
Project Development and Environmental Analysis Branch,
Human Environment Unit

July 2008

Management Summary

On April 3, 2008 North Carolina Department of Transportation (NCDOT) archaeologists Caleb Smith and Ben Jackson inspected site 31FY1160**, the remains of a structure located near the proposed US 52 improvements in Winston-Salem (NCDOT TIP U-2826B). The proposed improvements to US 52 will improve intersections at a number of streets in the vicinity of US 52, close several on- and off-ramps, convert US 52 shoulder lanes to traffic lanes, replace two of the US 52 bridges, and improve Martin Luther King Drive. It will not impact any landforms with the potential for intact archaeological resources. The North Carolina State Historic Preservation Office (HPO) recommended no archaeological investigations for the project on February 15, 2007 (ER 05-0934).

This project was not an archaeological survey, and the goal was not to conduct a field survey of the Area of Potential Effects (A.P.E.). A survey had not previously been conducted for the US 52 improvement projects because the HPO had not requested one, and NCDOT archaeologists were not involved until NCDOT Natural Environment Unit (NEU) personnel identified the structural remains during the delineation of wetlands and streams for the project. The goal was therefore to investigate the structure, record its physical aspects, determine its age, origin, and purpose, and evaluate it for potential inclusion on the National Register of Historic Places (NRHP).

The structure is located on the east side of US 52 approximately 518 meters (1,700 feet) south of where it crosses over Glenn Avenue. It is a short distance (2 meters [6 feet]) outside of the existing US 52 right of way (ROW) and will not be impacted by the improvement project. It is a cement structure approximately 30 meters (100 feet) long and 10 meters (33 feet) wide, with arched windows and an arched entrance. Background research concluded the structure may have been the foundation of a rotary kiln in the Carolina Ore Company Nodulating Plant. The rotary kiln operated from circa 1912 to the late 1920s.

Site 31FY1160** is recommended ineligible for the NRHP due to a lack of integrity. This is actually a part of a larger structure, and that was only one of several that made up an industrial complex. Almost all of the structures were removed when the company shut down, and/or they were destroyed by the construction of US 52. This site has been disturbed and is not an intact resource. The foundation alone cannot add much to our knowledge of the Carolina Ore Company, of Winston-Salem's industrial past, or the workings of a nodulating plant. Because of all these factors the structure is recommended ineligible for the NRHP and no further archaeological work is recommended.

Chapter 1: Introduction

On April 3, 2008 North Carolina Department of Transportation (NCDOT) Archaeologists Caleb Smith and Ben Jackson inspected the remains of a structure (site 31FY1160**) located near the proposed US 52 improvement project (NCDOT TIP U-2826B) in Winston-Salem (Figure 1). The project will include improving intersections at a number of streets in the vicinity of US 52, closing several on- and off-ramps, converting US 52 shoulder lanes to traffic lanes, replacing two of the US 52 bridges, and improving Martin Luther King Drive. The structure is located on the east side of US 52 approximately 518 meters (1,700 feet) south of Glenn Avenue. Two of the improvements will be implemented in the vicinity of the structure (Figure 2). Alternative 9 will include changes to the interchange at Akron Drive located approximately 900 meters (2,953 feet) north of the structure. The replacement of the US 52 bridge over the Norfolk-Southern Railroad is located approximately 400 meters (1,312 feet) south of the structure. Both of these improvements will be conducted within the existing right of way (ROW) of US 52 and will not impact the structure.

The US 52 improvement project will receive Federal funding and permits. Therefore the Federal Highway Administration (FHWA), with the NCDOT acting as its agent, must consider the protection of historic and archaeological resources in the decision-making process of transportation projects. The NCDOT, in consultation with the State Historic Preservation Office (HPO), must make a "reasonable and good faith effort" to identify historic properties that may be effected, and gather sufficient information to evaluate their eligibility for inclusion on the National Register of Historic Places (NRHP). The NCDOT began consultation with the HPO when the Project Development Engineer provided information about the project on April 28, 2005. An Area of Potential Effects (A.P.E.) had not yet been determined, so the HPO was given a large study area. HPO recommended that a historic background research report be prepared to identify all potentially historic resources within that study area on August 22, 2005 (ER 05-0934). However, NCDOT archaeologists narrowed down the study area by providing additional information about the improvements to HPO on November 20, 2006. This showed the A.P.E. consisted of disturbed ROW in a heavily developed part of Winston-Salem. HPO recommended no archaeological investigations for the project on February 15, 2007.

This archaeological project was conducted because NCDOT's Natural Environment Unit personnel reported structural remains adjacent to the project area, not because of a survey request from HPO. This report describes the investigation of the structure and the efforts to identify its origin, age, and purpose, only. It was not an archaeological survey of the A.P.E. of the US 52 project.

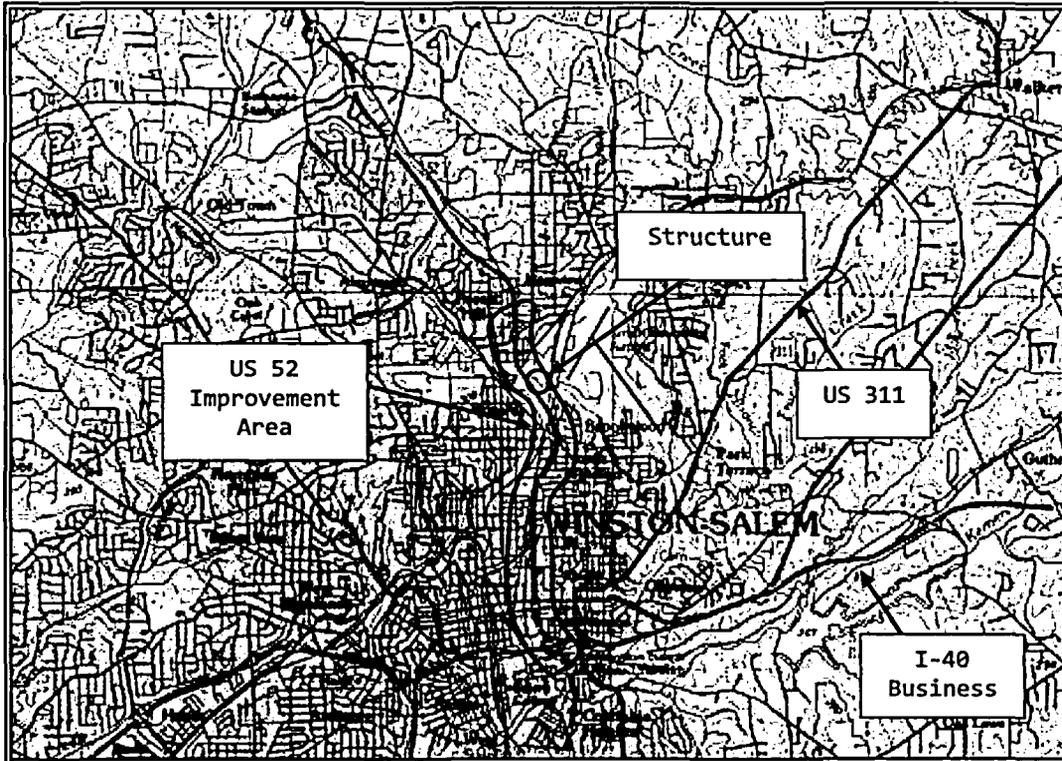

Figure 1: General location of the US 52 Improvement project (USGS 1985 *Winston-Salem, N.C.* 1:100,000 scale topographic map).

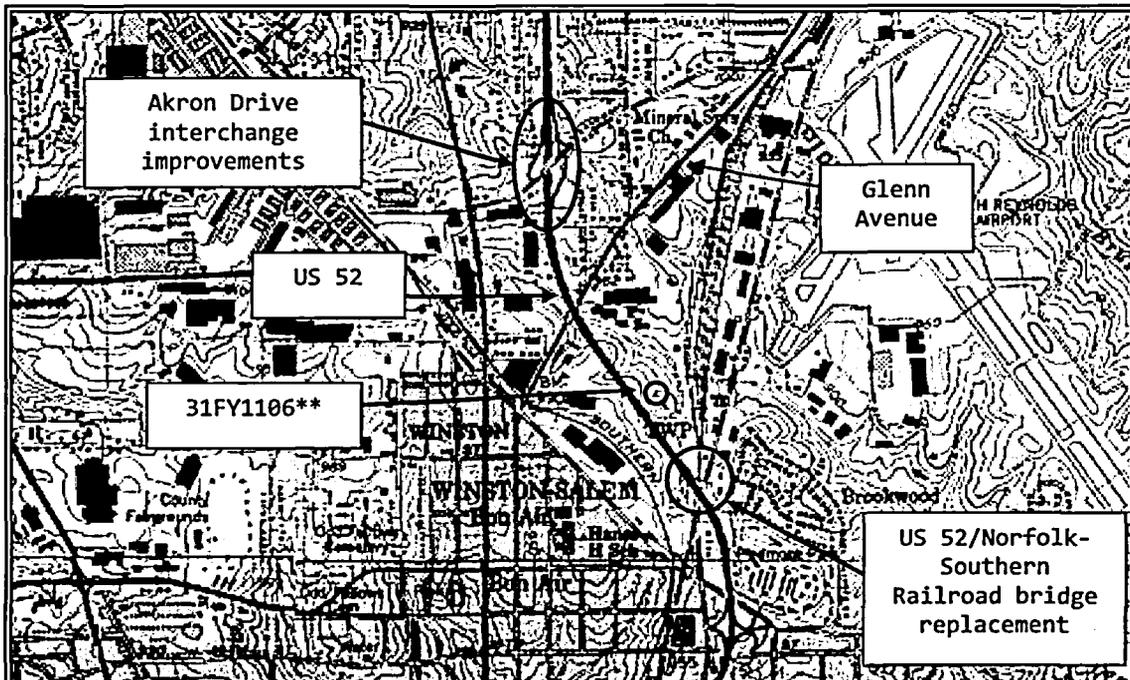

Figure 2: Approximate location of site 31FY1106** in relation to the US 52 improvements (USGS 1971 *Walkertown, N.C.* 1:24,000 scale topographic map).

Chapter 2: Field Inspection

NCDOT archaeologists Ben Jackson and Caleb Smith inspected 31FY1160** on April 3, 2008 (Figures 3 and 4). The field inspection was not an archaeological survey of the A.P.E. of the US 52 improvement project. As described in Chapter 1, HPO had recommended no archaeological survey because of the limited extent of the improvements, and because the improvements would not impact any landforms with archaeological potential. This field inspection was conducted solely in response to the report by NCDOT NEU personnel in February 2008. It was a visual examination only and no shovel tests were excavated.

The structure is shown on the public hearing map for the US 52 project (Figure 5). The structure is located approximately 10 meters (33 feet) east of the US 52 pavement and 20 meters (65 feet) west of a gravel road. (For the purposes of this description both US 52 and the railroad tracks are "grid" north although US 52 is actually 330° [northwest].) The gravel road provides access to the structure from the north. There is a locked gate from the Recycling Industries of Winston-Salem facility located to the north on Glenn Avenue. The structure is located approximately 100 meters (328 feet) south of the gate. The gravel road continues south to the US 52 bridge over the Norfolk and Western Railroad tracks.

The structure measures approximately 30 meters (100 feet) long (east/west) and 10 meters (32 feet) wide (north/south). There is no roof over the eastern three-fourths of the structure and no visible evidence of roof supports. The western quarter of the structure does have a roof (or the floor of an upper story?). The outer walls of the structure are cement made with large gravel (Figure 6). Steel rails are located along the top edge of some of the walls. The walls are 30-centimeters (1-foot) thick and have built-in column supports that measure 61 centimeters (2 feet) square. The building has an arched entrance on the east side and four arched windows each on the north and south walls.

Visual examination did not provide many clues about the building's age or purpose. It is constructed of cement, a building material that is difficult to use as an indication of age. It does not appear to be modern because there are no modern construction materials like cinderblocks or cored bricks (with holes in them). About the only clues are the arched windows and doors that could indicate the "Romanesque Revival" style of the late nineteenth century (Taylor 1981:237). There are several hardwood trees growing inside of the structure. Based on their size they appear to be 20-30 years old.

There is a small cement pad (foundation?) located approximately 5 meters (16 feet) to the south. Coal is scattered around this area, and there are two small cement pylons located on the south side of the pad. Each pylon has a piece of rebar or a bolt sticking out of the top. The pylons are shaped like pyramids and are approximately 1 meter (3 feet) tall. They may have been supports for some kind of machinery like a conveyor or sluice.

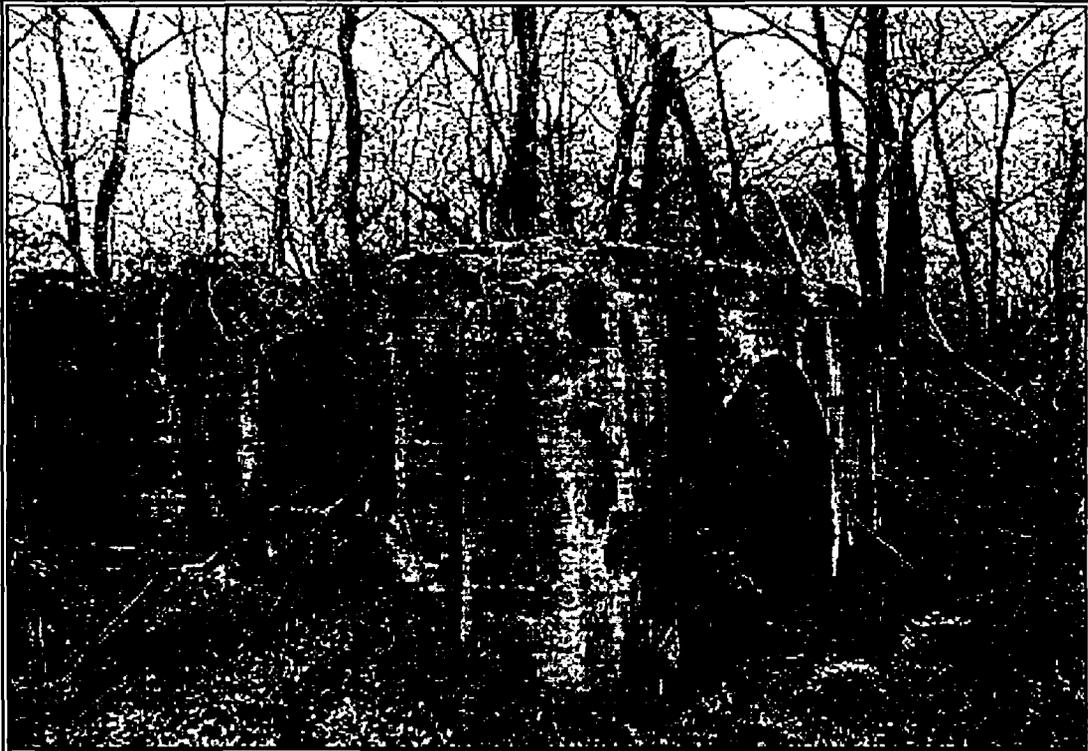

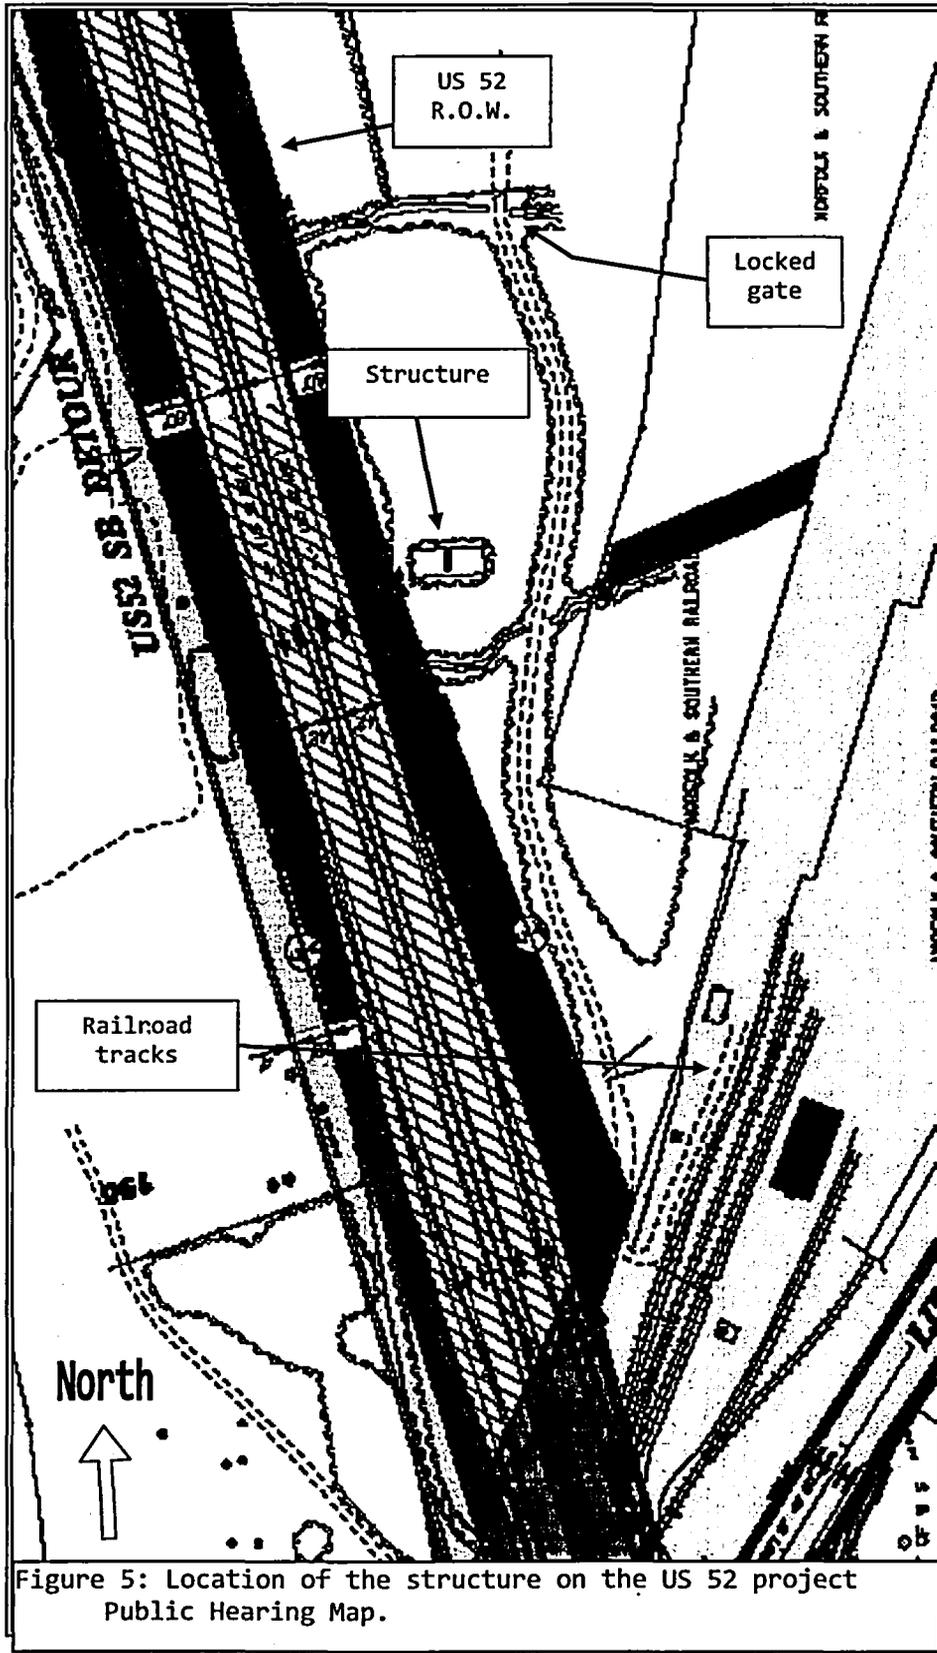

Figure 3: Northwest view of the structure.

Figure 4: South view of the structure.

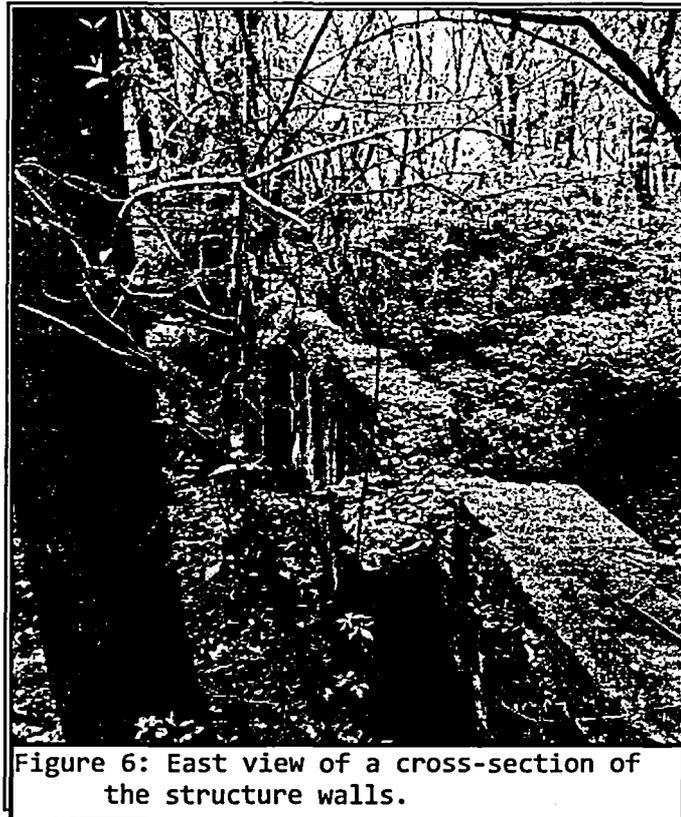

Figure 6: East view of a cross-section of the structure walls.

There are several drainage ditches and/or creek beds in the area, some of which could be man-made drainage for US 52. The 1951 edition of the topographic map shows two permanent streams in this area. A deep east/west ditch is located approximately 40 meters (131 feet) south of the structure. This could be a natural stream bed or a US 52 drainage ditch.

The area is very overgrown so it was hard to see any other surface features (Figure 8). While I did not inspect all of the surrounding area, there are several disturbed areas along the gravel road from the gate south to the railroad tracks. It was assumed that this location would be disturbed to some extent because it is between US 52 and the railroad tracks, and this was the primary reason the HPO did not recommend an archaeological survey. In general, developed areas have little potential for intact archaeological sites due to disturbance from construction, maintenance, and landscaping. The disturbance at this location could have also been caused either by construction of other buildings or from the dumping of construction rubble. For example, during the initial search for the structure I climbed on top of a mound of building rubble located inside the fence to the north of the structure. Also, the ground in many places feels unstable as if there was a landfill underneath, and examination of drainage cut banks and road cuts show building materials eroding out of the soil.

Figure 7: Southwest view of the dense undergrowth around the structure.

There are several plastic pipes sticking out of the ground at various locations. The pipes are anchored in cement and have padlocks on them. NCDOT Natural Environment Unit staff led me to the Superfund Section of the North Carolina Department of the Environment and Natural Resources (NCDENR) in Winston-Salem. According to Mr. Collin Day, staff with the Superfund Section, the pipes are groundwater monitoring wells installed in summer 2005 (personal communication 2008). Mr. Day provided much helpful information about the environmental conditions at the site as well as about the origin of the structure. Mr. Day has long been interested in the structure and has researched the history of this area. He provided a copy of an Environmental Assessment of a nearby tract of land that used to be owned by the NCDOT (CLP Services [CLP] 2005). This report has an extensive section about the industrial history of this area, and it will be discussed more in the next sections.

Chapter 3: Background Research

Methods

The background research section is presented after the fieldwork section because the project was conducted in that order. It began as a response to a report from NCDOT NEU personnel about structural ruins near the project area. The examination of the structure and surrounding area raised many questions about its age, origin, and purpose.

The background research effort included a review of previously recorded archaeological sites in the area, and the examination of historic maps, histories of Forsyth County and Winston-Salem, and other documentary sources about the industrial development of this area. The review of previous archaeology was conducted at the North Carolina Office of State Archaeology in Raleigh. There are no previously recorded archaeological sites in the vicinity. Historic maps used for this project included Fries (1898), Miller (1907), Sanborn-Ferris Map Company (1900), Sanborn Map Company (1907, 1912, 1917), U.S. Department of Agriculture (USDA [1913]), and USGS (1951). Not all of these maps will be included in the report because some were not very helpful. Published histories of Winston-Salem and Forsyth County are located at the State Archives Library in Raleigh. These included Fries et al. (1976), Rondthaler (1928), Taylor (1981), Shirley (1994), Brownlee (1977), Mellman and Tise (1976), and Smith (1977).

Background research also included an examination of a collection of records about the Southern Chemical Company/ Virginia-Carolina Chemical Company. These are located at the Special Collections Department of the William Madison Randall Library at the University of North Carolina in Wilmington. The special collection (#105) is called "Documents Relating to the Fertilizer Industry". It contains files about the companies including specific information about the Forsyth County factory located adjacent to the project area. The Forsyth County information is located in 66 folders within Box 6 of Special Collection 105, so the information will be referenced by collection (105), box (66), and file number.

The environmental evaluation report of an adjacent tract of land (CLP 2005) included a land use history that was extremely helpful for this project. Mr. Fambrough Brownlee, librarian at the Forsyth County Library Central Branch's North Carolina Room, provided information about the Carolina Ore Company.

Historic Maps

Since the field examination identified the remains of an historic structure the first step was to examine maps of the Winston-Salem area from the late 1800s through the mid 1900s. The map by Miller (1907) is a very detailed map of the area (Figure 8). It shows roads, railroads, major streams, and structures, including the name of the business or resident. The main landmark that can be used to locate the project area is the place on the north side of Winston where the two railroads separate. The Northwestern North Carolina Railroad continues

to the northwest and the Roanoke-Southern Railroad turns to the northeast. The project area is located between the railroads to the north of where they part ways.

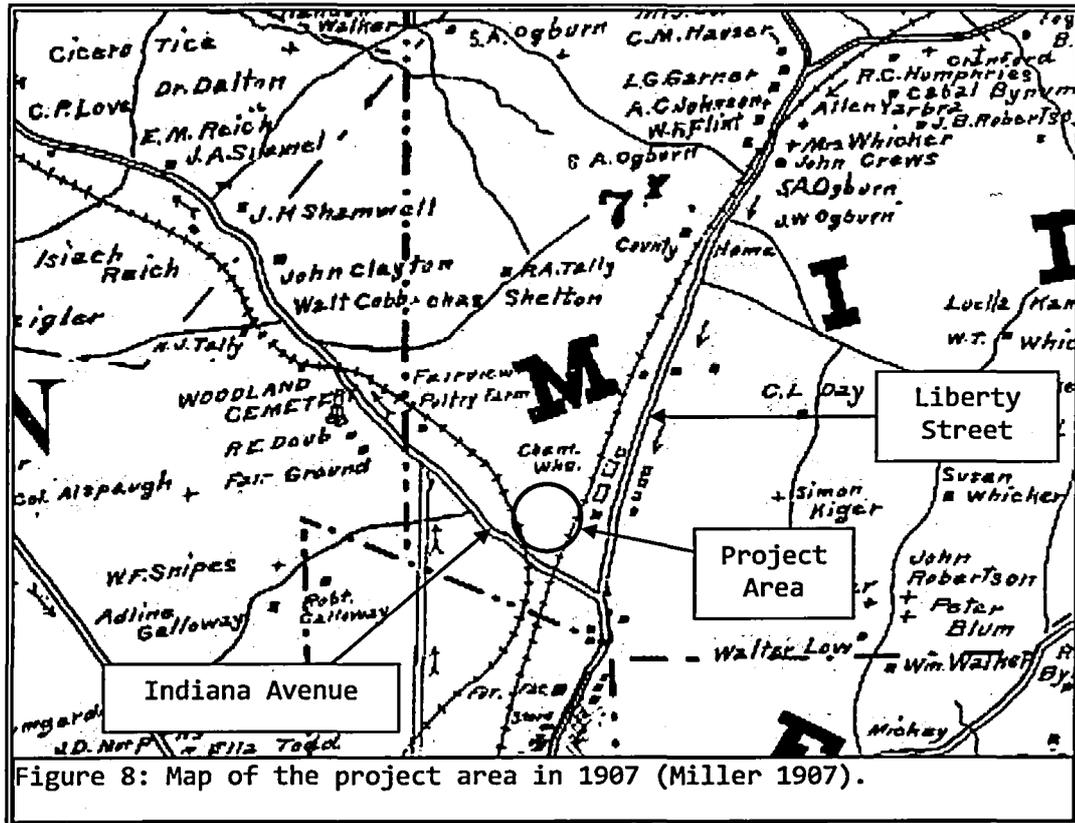

Figure 8: Map of the project area in 1907 (Miller 1907).

The road that would later become Liberty Street runs along the east side of the *Roanoke and Southern*, and the road that would become Indiana Avenue runs along the southwest side of the *Northwestern North Carolina*. The project area is located to the north of where future Indiana Avenue crosses the railroad tracks. No structures are shown in the project area. There are several large buildings located to the east between Liberty Street and the railroad tracks labeled "Chem. Whs."

The 1913 soil map (USDA 1913) is a detailed map that shows soil types, roads, railroads, streams, and structures (Figure 9). There may be a structure in the project area but it is hard to tell because the map is somewhat crowded at that point. The map shows that there was not much development near the project area at that time.

The Sanborn Fire Insurance maps of Winston-Salem are extremely detailed depictions of almost every building and house in the city. The 1900 map (Sanborn-Ferris Map Company 1900) shows the Southern Chemical Company Fertilizer Works at this general location. Later Sanborn maps (Sanborn Map Company 1907, 1912, 1917) show the fertilizer works belonging to the Virginia-

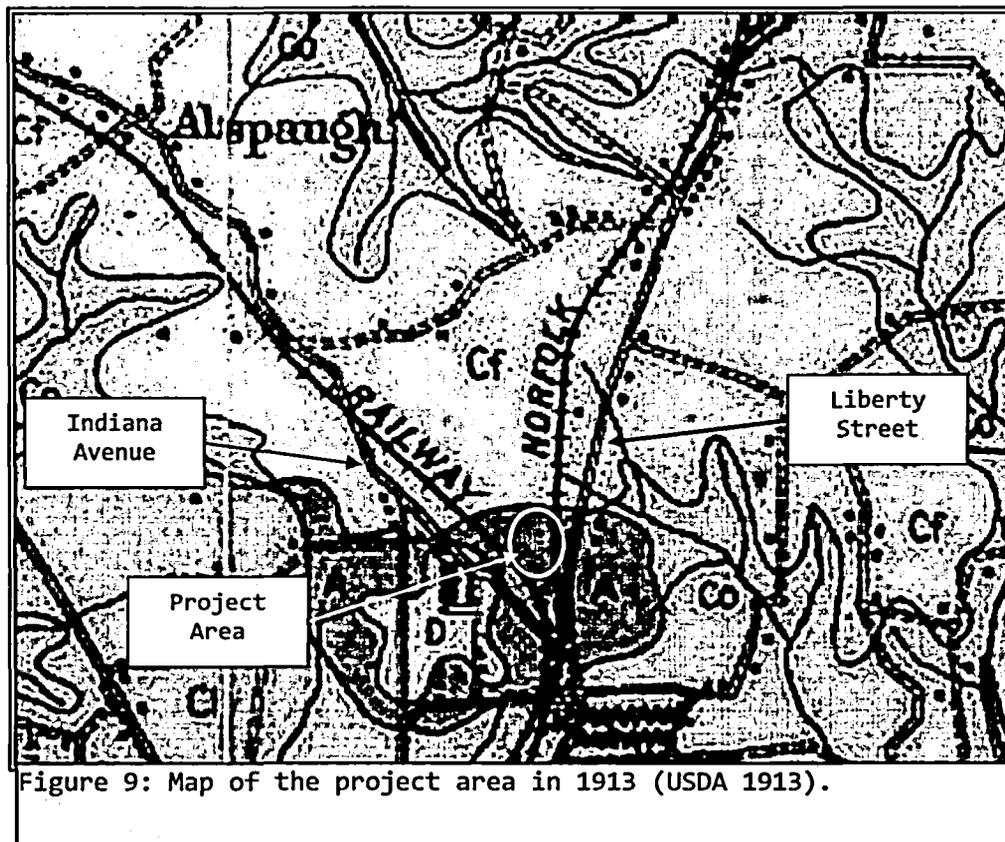

Figure 9: Map of the project area in 1913 (USDA 1913).

Carolina Chemical Company. The chemical factory facility is shown on the Sanborn maps until 1917 (Figure 10). These maps provide detailed diagrams of the fertilizer factory from 1900 to 1917. There is a group of buildings located to the northwest of the factory labeled the Carolina Ore Company Nodulating Plant. The Carolina Ore Company appears on the Sanborn maps from 1912 to 1917.

The structure may be one of the buildings shown on the Sanborn maps but it is difficult to identify which one. There are few reliable landmarks to use for reference. Today the major feature is US 52, but it was not constructed until sometime after 1951.

Identification of the Structure

The maps indicate site 31FY1160** was probably one of the Virginia-Carolina Chemical Company or Carolina Ore Company buildings. A landmark that is shown on the Sanborn maps and the modern maps is needed to identify which building it may have been. Although the Sanborn maps have accurate scales and direction, the task is challenging because the construction of US 52 destroyed, disturbed, and rearranged many of the natural and man-made features in the area.

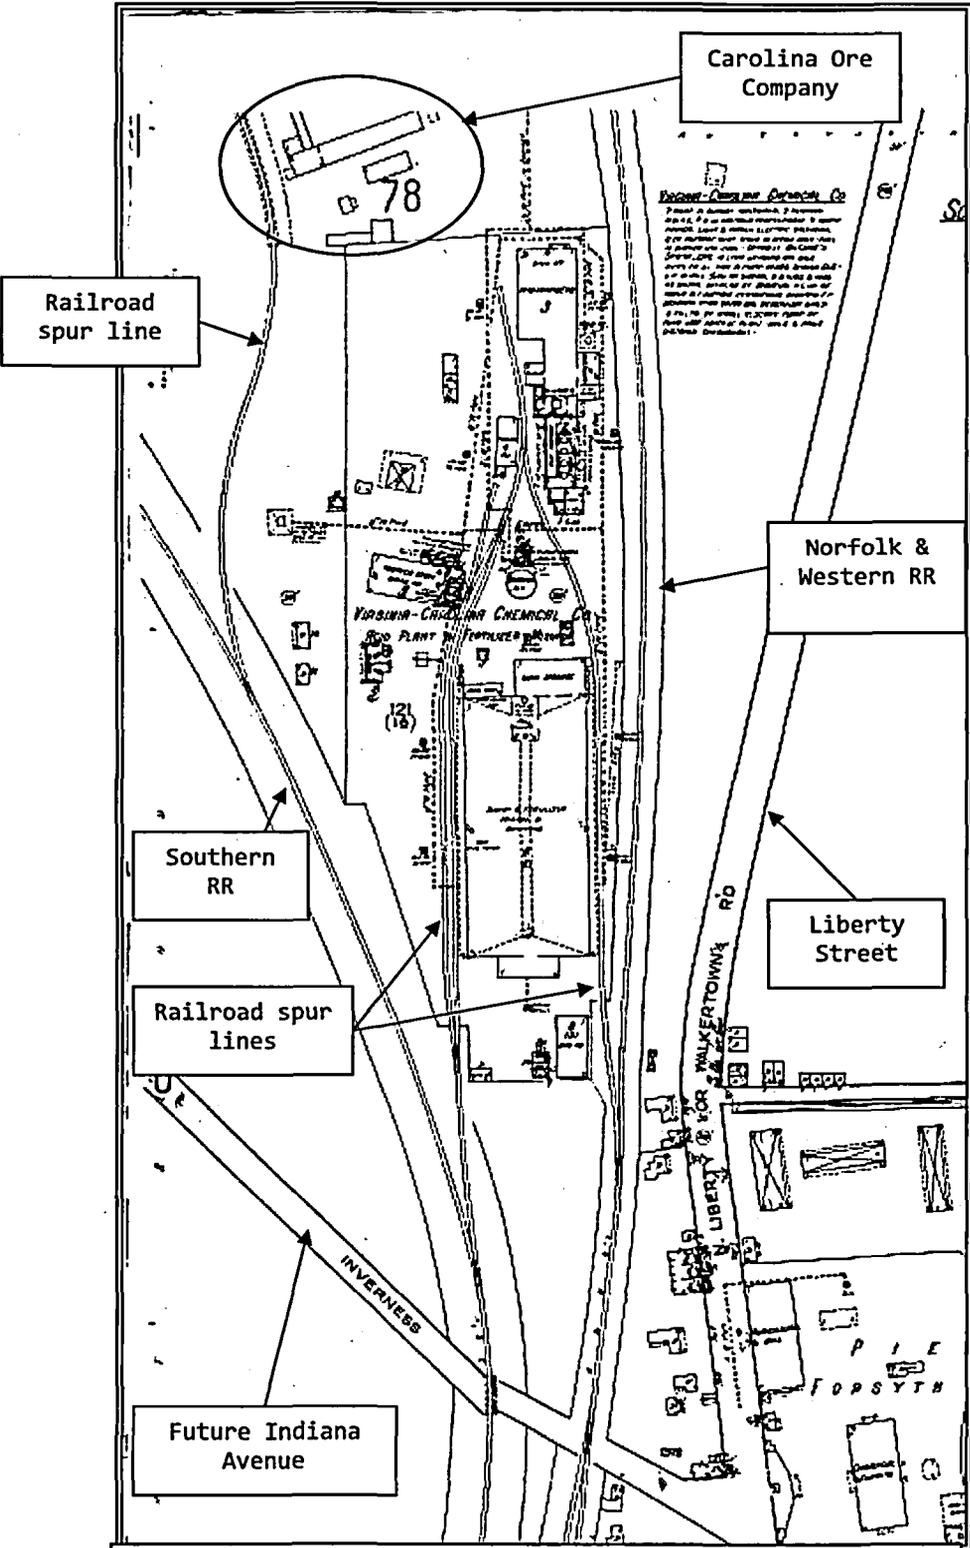

Figure 10: Map of the Virginia-Carolina Chemical Company fertilizer works in 1917 (Sanborn Map Company 1917).

The Sanborn maps show the fertilizer plant located along the west side of the Norfolk & Western Railroad. The distance from the railroad as shown on the Sanborn map may not be reliable because it has expanded to approximately five rail lines since the early 1900s, and it is not known whether the expansion was west or east from the original line. The records of the Virginia-Carolina Chemical Company indicate the railroad companies built several spur lines into the factory complex. When the factory shut down the company removed the buildings and the railroad removed their spur lines and purchased several tracts of land within or adjacent to the factory. Figure 11 is a property map showing a 2-acre section of land along the east side of the railroad (between it and Liberty Street) that was sold to the *Norfolk and Western* in 1923 (105/6/52). This indicates the railroad probably expanded in that direction.

Liberty Street is another landmark that can be used for orientation. It is not shown on the 1900 and 1907 Sanborn maps, and only the southern part is shown on the 1912 map. In the early 1900s the project area was located at the northern edge of development so the Sanborn maps did not include much of the surrounding area. The 1917 map shows Liberty Street in the same general location as today (along the eastern side of the railroad), but it is difficult to identify which part of Liberty from which to take a measurement. Liberty Street gradually moves away (east) from the railroad tracks as it continues to the north, so there is no recognizable point on the street from which to measure. Also, it has almost certainly been expanded and/or realigned since then. For instance, the 1920s property map in Figure 11 shows an old version of Liberty Street ("abandoned Germanton Road") located along the west side of what was then the "new concrete road (Liberty Street)." This may have replaced the version of Liberty Street (also called Walkertown Road) shown on the 1917 Sanborn map. The route of Liberty Street has probably been altered since then with the expansion of the railroad and the construction of the airport. Liberty has probably been realigned to some extent to accommodate the entrance and exit ramps for US 52, also.

The 1917 Sanborn map shows a road called "Inverness" that crosses the railroad tracks to the south of the factory. This road was presumably named for the Inverness Cotton Mill established in 1910 (Rondthaler 1928:2981). The cotton mill is shown on Figure 11 but the road is named Old Town Road. In any case, the road appears to be the one that would become Indiana Avenue. If Indiana Road is has remained in approximately the same location, the intersection of it and the railroad tracks would be a good landmark to use for measurement.

It is difficult to use the modern topographic map because the structure is not shown on it. Likewise the public hearing map in Figure 5 can't be used because it doesn't show the intersection of Indiana Avenue and the railroad. The modern aerial photograph does show the intersection, but the structure is not visible (Figure 12). (The red line in this photograph is not the A.P.E.) The location of the structure can be identified by using a measurement taken in the field from two landmarks that are visible in the photograph, the access gate and gravel road from the recycling center. Field measurements indicate the structure is located approximately 100 meters (328 feet) south of the gate and 20 meters (66 feet) west of the gravel road. This places the structure

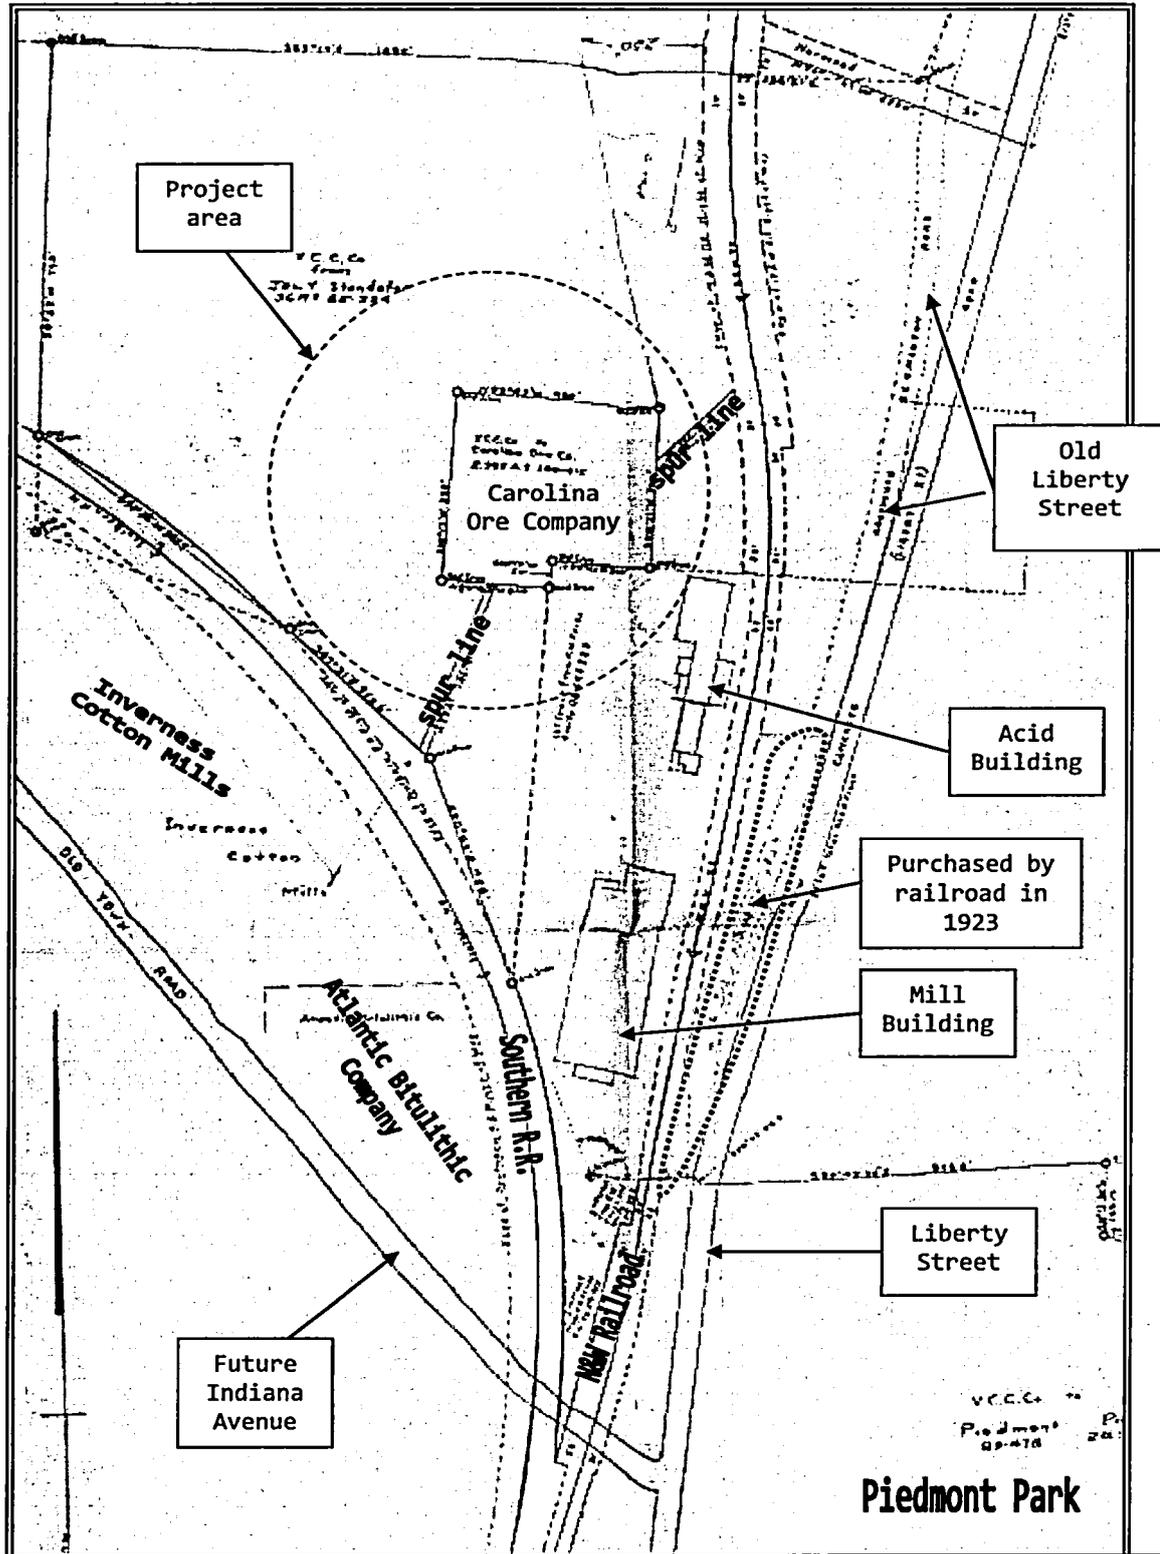

Figure 11: Property map showing the project area in 1923/1927 (105/6/52).

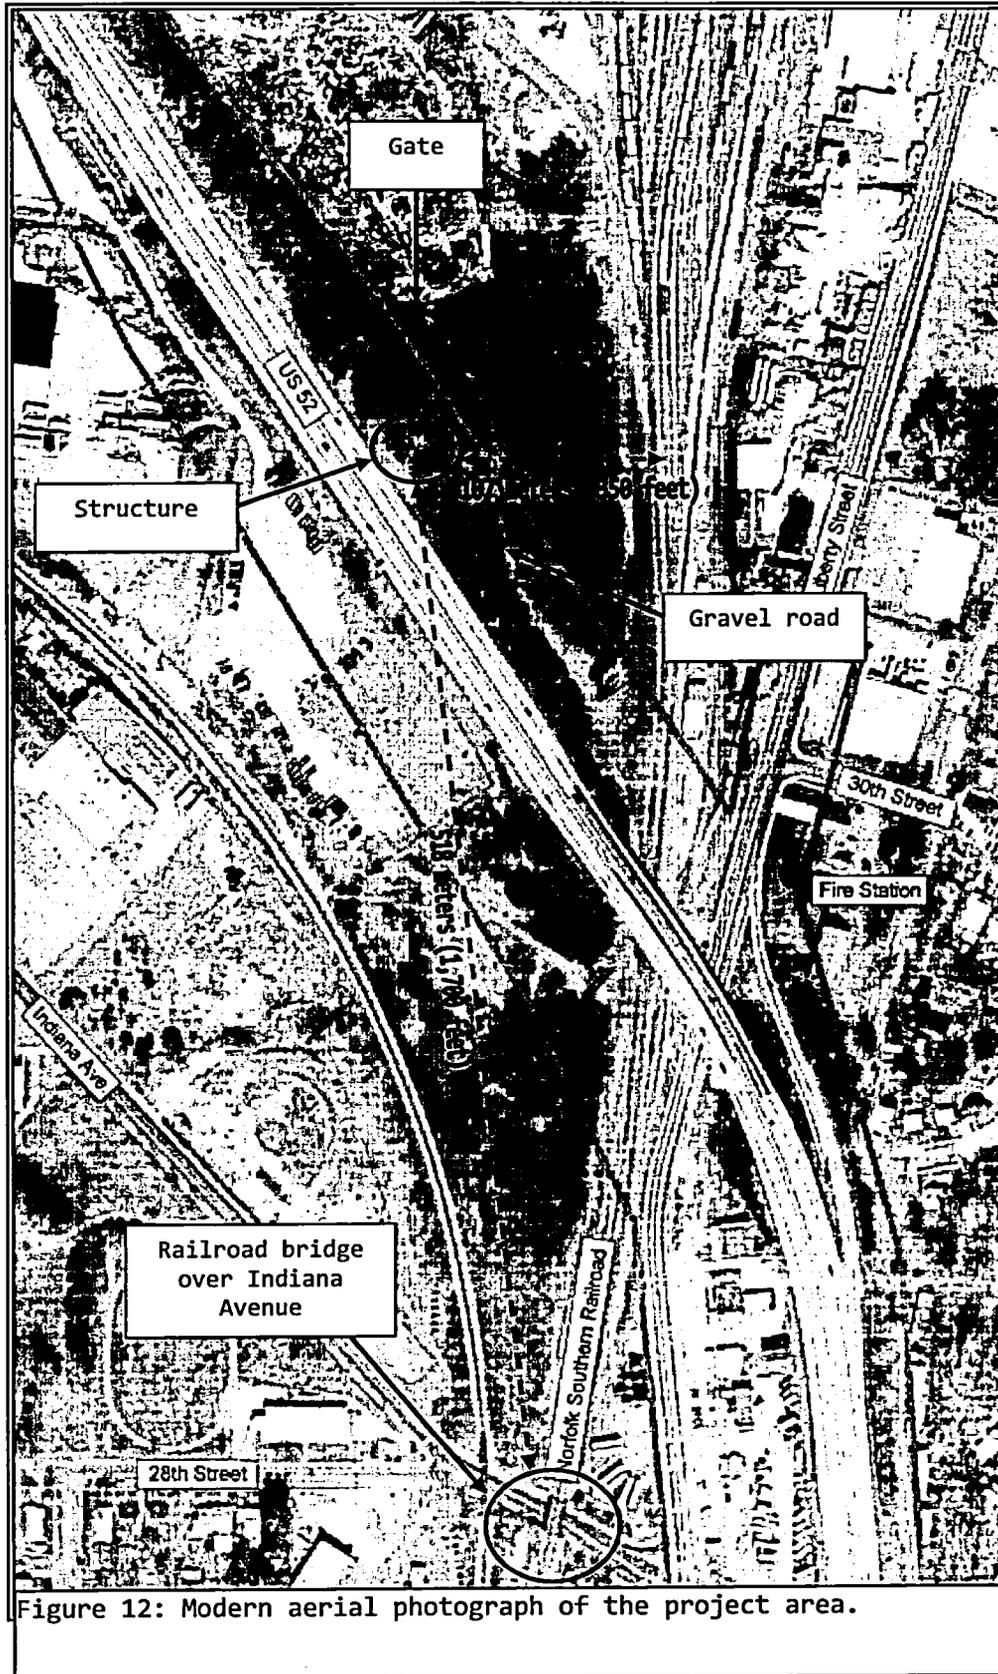

Figure 12: Modern aerial photograph of the project area.

approximately 518 meters (1,700 feet) north of the railroad bridge over Indiana Avenue and approximately 107 meters (350 feet) west of the railroad tracks. If those scale measurements are correct and are applied to the Sanborn maps, the structure would be located within the Carolina Ore Company nodulating plant located on the north side of Virginia-Carolina. However, this conclusion is tentative because the two factories were only separated by approximately 60 meters (200 feet). Historic map measurements should always involve some margin of error, and 60 meters (200 feet) is certainly within the margin.

The comprehensive environmental report (CLP 2005) discusses the industrial contaminants that could have been produced by the former industries located at an old asphalt testing facility located across US 52 from the project area. In order to track potential pollution sources it provides a detailed land use history of the Virginia-Carolina Chemical Company property, the area along the Norfolk Southern Railway, and the Carolina Ore Company property. It bases much of the land history on the Sanborn maps and aerial photographs taken in the 1960s. The aerial photographs show the project area before, during, and after the construction of US 52 (CLP 2005: Figures 20, 22, 24, 26). The 1960 aerial shows the former location of the Virginia-Carolina acid building, the outlines of several other buildings, and railroad spur lines. As described above all buildings and spur lines had been removed from the factory property by the late 1920s. But most important is that the aerial photographs clearly show the outline of the structure that is the subject of this report (Figures 13 and 14). They identify the building as the Carolina Ore Company's "rotary kiln foundation."

The Carolina Ore Company Rotary Kiln

CLP (2005) concluded that the structure was the foundation of the rotary kiln of the Carolina Ore Company nodulating plant. This agrees with the results of my analysis in the previous section. However, my conclusions were tentative because of the considerable disturbance that has occurred in this area, the shortage of reliable landmarks, and the margin of error that should be accepted when using historic maps. The authors of the CLP (2005) report do not support their conclusion. Perhaps it was not necessary since the subject of the report, "Site 54," was located on the other side of US 52. My background research cannot confirm that the structure was one of the buildings in the Carolina Ore Company nodulating plant, but it is the working hypothesis.

The Carolina Ore Company was organized in 1910 with \$125,000 capital stock and it filed capital reports with the North Carolina Corporations Commission until 1912. Its charter was revoked in 1924 because of failure to file (CLP 2005:32-33). The company is mentioned in Rondthaler (1928:28), who states it was established in 1910 "to convert the by-products of the fertilizer plants of this section into high-grade furnace ore." According to Pratt (1914:72):

"A company known as the 'Carolina Ore Company' of Winston-Salem was recently organized for the purpose of converting the refuse from a

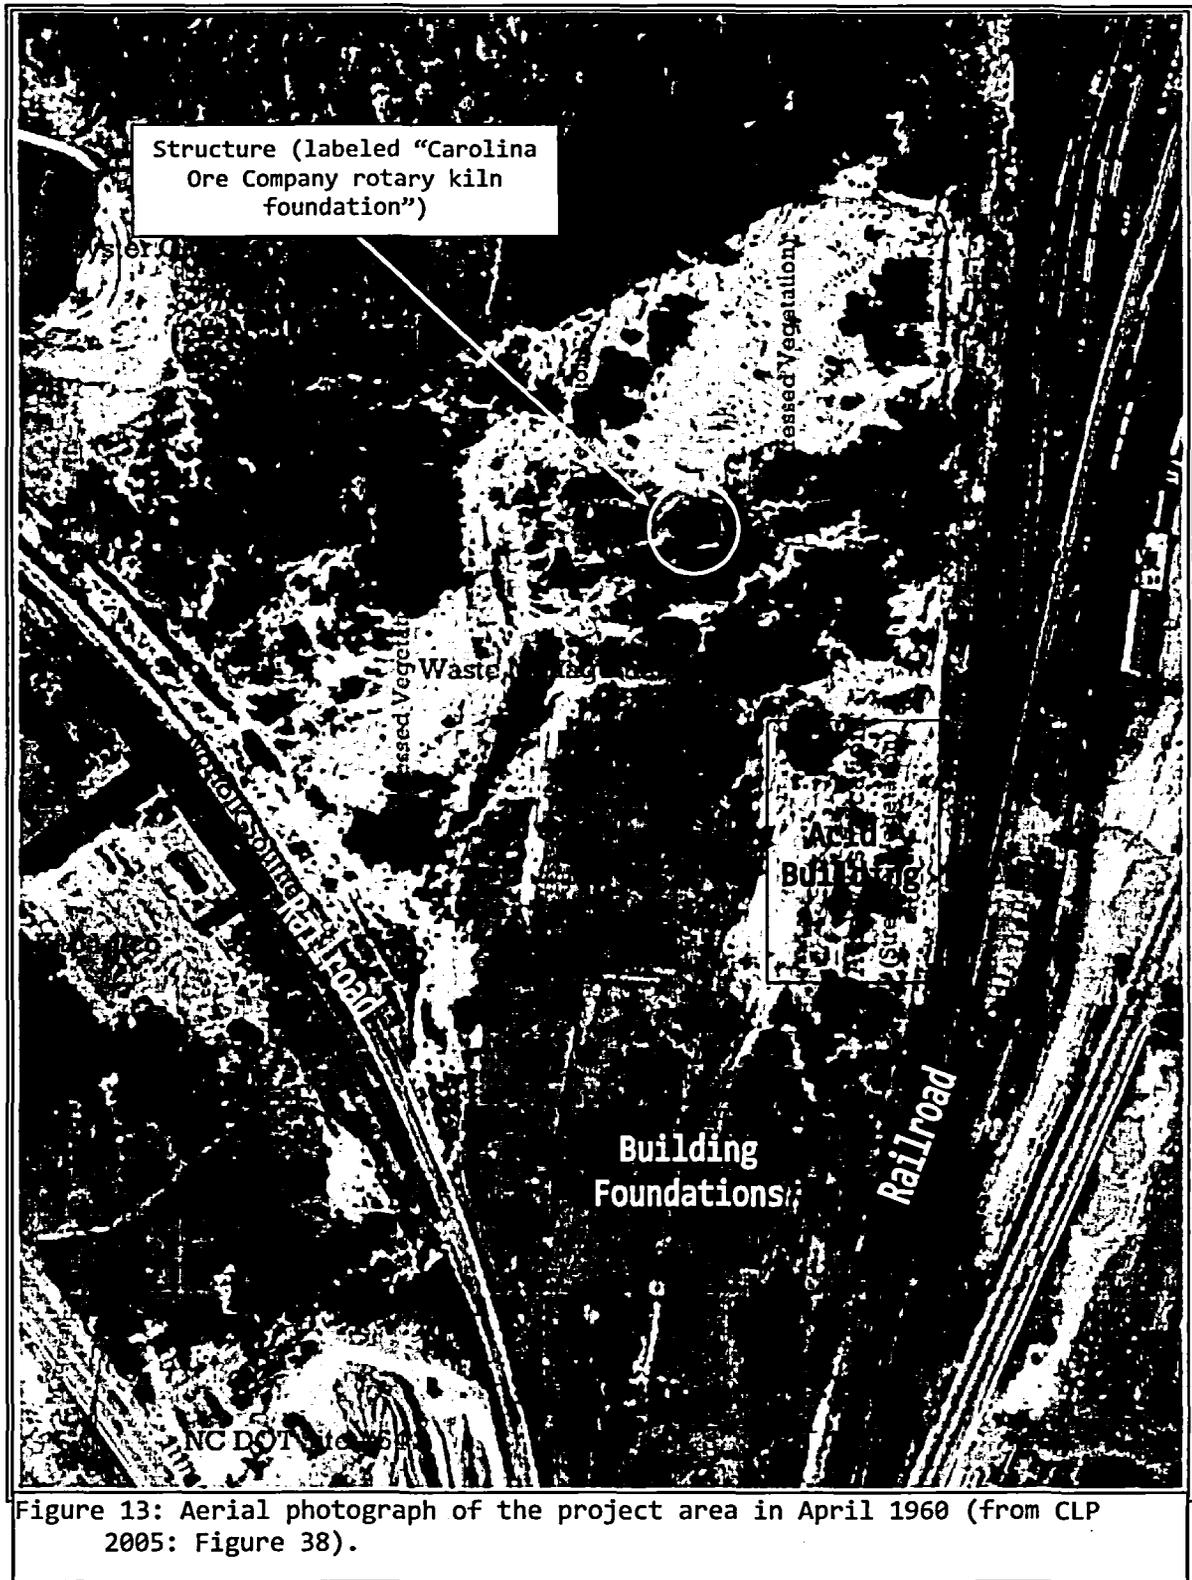

Figure 13: Aerial photograph of the project area in April 1960 (from CLP 2005: Figure 38).

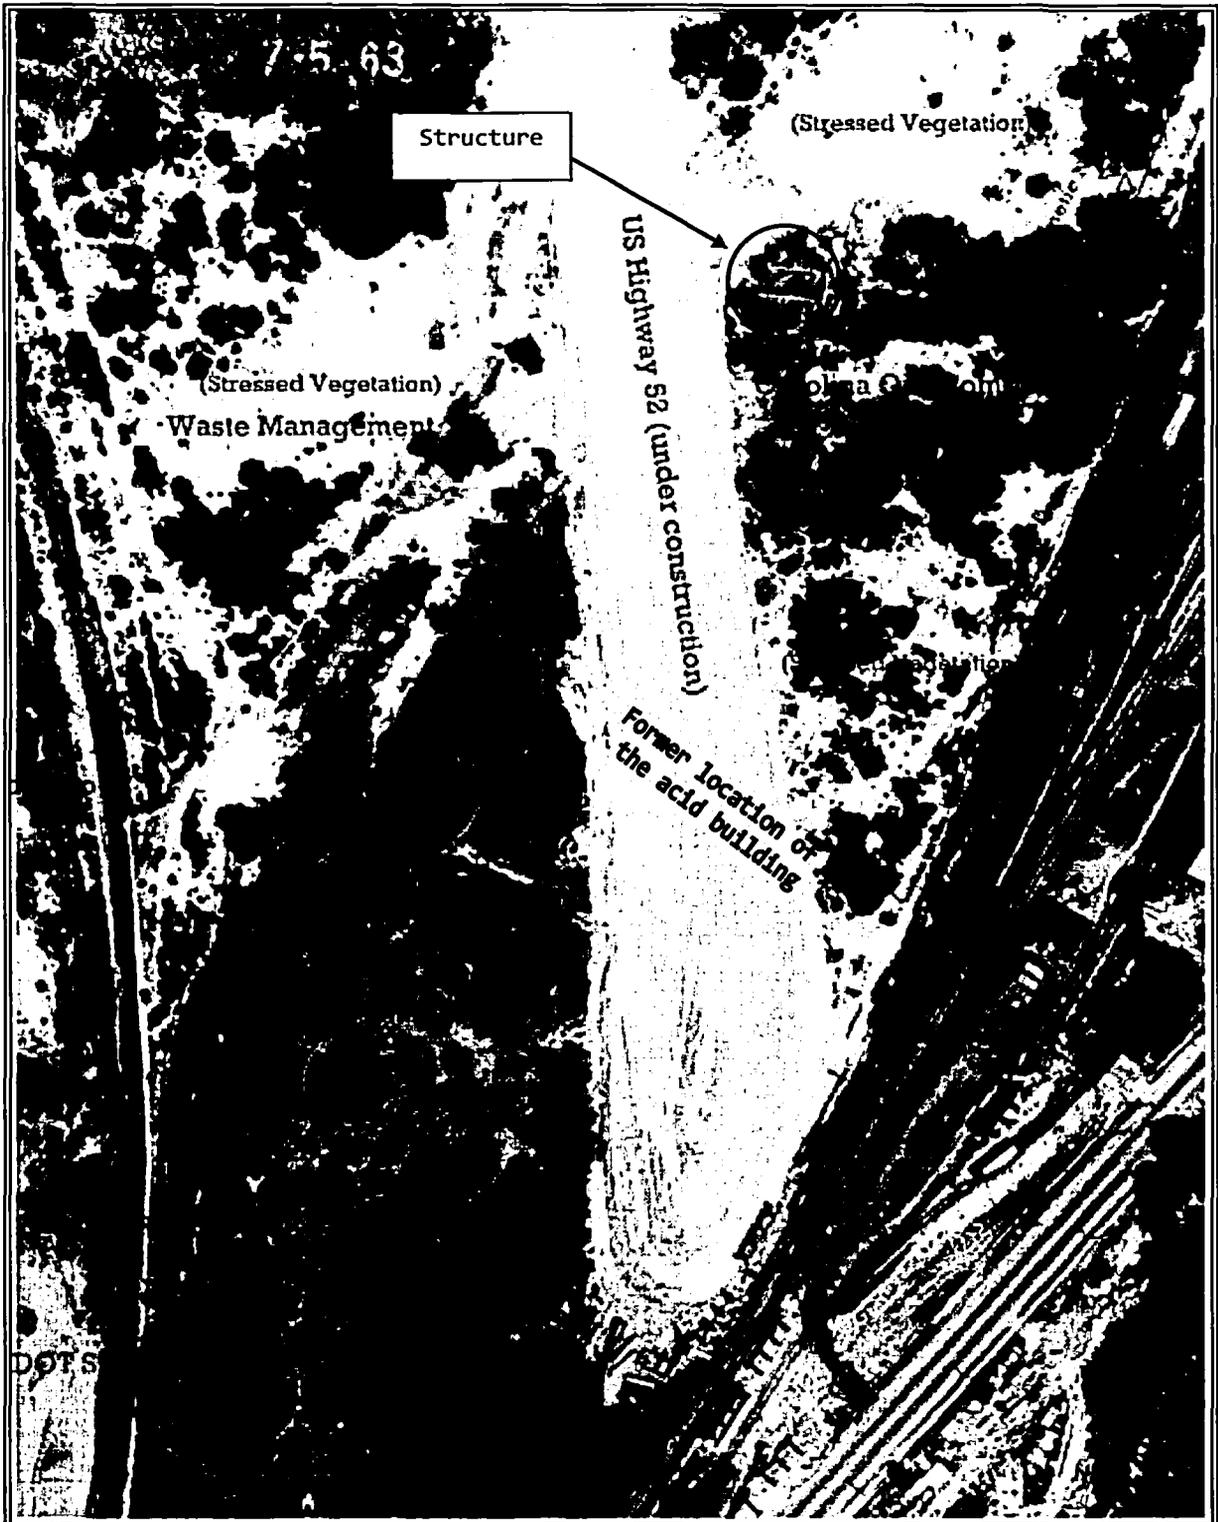

Figure 14: Aerial photograph of the project area in July 1963 (from CLP 2005: Figure 24).

sulphuric acid plant into ore briquettes or nodules, which can be shipped to the iron furnace in Virginia. This company has made contracts with a number of other plants for their iron oxide refuse, with which they will make iron ore."

Carolina Ore is listed in the Winston-Salem City Directories from 1911 through 1923. The directories list J.L. Ludlow as President and W.T. Brown as Secretary/Treasurer. It may have been a subsidiary of the Virginia-Carolina Fertilizer Company. Virginia-Carolina was a huge corporation that had dozens of subsidiaries (United States Federal Trade Commission [FTC] 1916:182), and it would be a logical relationship since Carolina Ore did use the byproducts of the fertilizer factory. Virginia-Carolina did have several affiliated companies that were not involved in fertilizer manufacturing, including several phosphate mining companies (FTC 1916:191). Another link is that Carolina Ore's Secretary/Treasurer, William T. Brown, was on the Board of Directors of the Southern Chemical Company and was President of the Union Guano Company, both owned by Virginia-Carolina. Also, City Directories show that Virginia-Carolina, Union Guano, and Carolina Ore had offices in the same building, the Masonic Temple. An argument against a connection is that there is no mention of this relationship in any of the Virginia-Carolina company papers, and the industry report by FTC (1916) does not mention any connection between them, either. According to Pratt (1914:72):

"In the manufacture of sulfuric acid from pyrite, if the ore is thoroughly roasted so that the sulfur is nearly driven off, the refuse, which is an iron oxide, will make a good ore of iron. In many instances the distance of transportation of this material to a blast furnace has prevented its being used as a source of iron."

The iron oxide refuse was then cooked and dried to avoid excess freight charges and/or to prepare it for additional processes (Raymond 1917:84-88). *Sintering* was one of several drying processes that were used to prepare the iron ore for the blast furnace. When this was done using a revolving cylinder the process was called *nodulizing*. The process of *briquetting* involved grinding the ore into a powder and adding milk of lime (Raymond 1917:88). This mixture was formed into small round cakes (briquettes) that could be easily shipped.

Figure 15 is a 1917 diagram of an iron ore nodulizing kiln. According to a contemporary description of the process (Harbison-Walker Refractories 1911:80-81):

"The nodulizing kiln consists of an almost horizontal cylindrical steel shell approximately 100' in length and possibly 8' in diameter, lined with a high grade fire brick, this high grade material being especially necessary at the hot or discharge end. The kiln is placed at a slight angle with the horizontal and rotates during its operation so that the charge is continually working toward the lower end. At this discharge end a pipe is introduced conveying powdered coal which is ignited, giving intense heat, and the feed end of the kiln is connected with a stack giving sufficient draft."

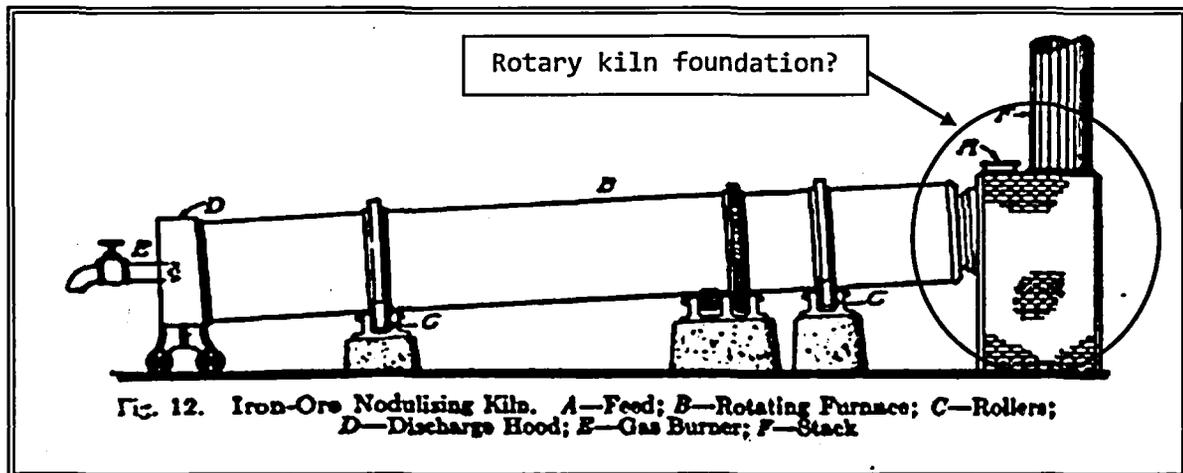

Figure 15: Diagram of an iron ore nodulizing kiln (Raymond 1917:Figure 12).

I could not find much information about nodulizing plants, possibly because it was a fringe industry that used the byproduct of one factory (fertilizer) to make a product for another (iron production). Figure 16 is a photograph of a concentrating and nodulizing plant in Lebanon, Pennsylvania. Unfortunately it does not show any of the structural features in detail. Research indicates that rotary kilns are used not only in the process of turning the byproduct of fertilizer, iron oxide, into iron ore, but also the cement industry. Cement is made with lime (as is fertilizer), and the lime is made by burning limestone. The rotary kiln is used to burn the limestone. There is no evidence that cement was made at this site. Photographs of historic cement kilns do indeed look similar to the structure. Figure 17 depicts a group of "upright" kilns, not rotary kilns. The beds of the kilns were accessed via arched doors that look very familiar. Limestone was loaded into the top and cooked until the finished product (lime in this case) ended up in the bottom (bed). The lime was removed via the arched entrances. Another photograph shows the ruins of a cement kiln that also has an arched doorway (Figure 18).

The Sanborn maps show the various components of the rotary kiln building and several support buildings (Figures 19-20). The main building appears to have been a long structure that surrounded or supported an iron tube labeled "rotary kiln" at the west end and "rotary cooler" at the east end. The building had a rectangular section at the west end that housed an electric motor and a flue. A railroad trestle was located near the west side of the building. The rotary kiln had a "cooler" at the east end of the tube, and an elevator and hopper rotary kiln tube. The tube slowly rotated and heated the iron ore using the "pulverized, gaseous soft coal" contained in the building to the south. The heated product slowly slid down to the cooler located at the east end of the tube. The finished product was fed into the elevator that lifted it up to the hopper and then into cars on the railroad line at the east side of the building.

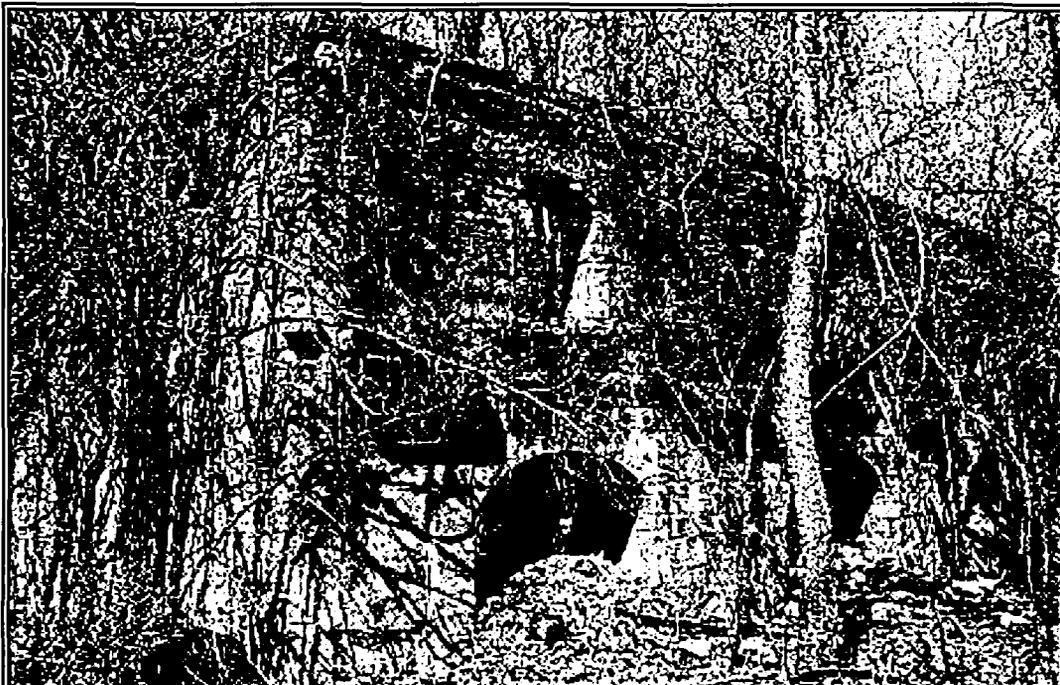

Figure 18: Photograph of the ruins of a kiln structure at the American Cement Company in California, New York (photograph from Williams 2007).

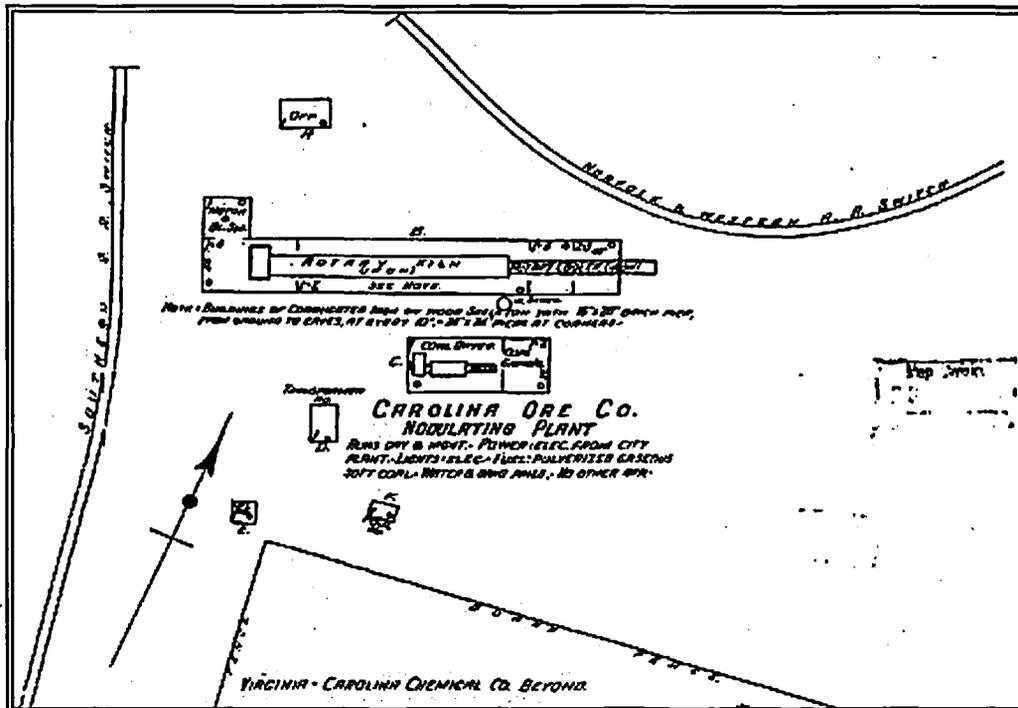

Figure 19: Detail of the Carolina Ore Company in 1912 (Sanborn Map Company 1912).

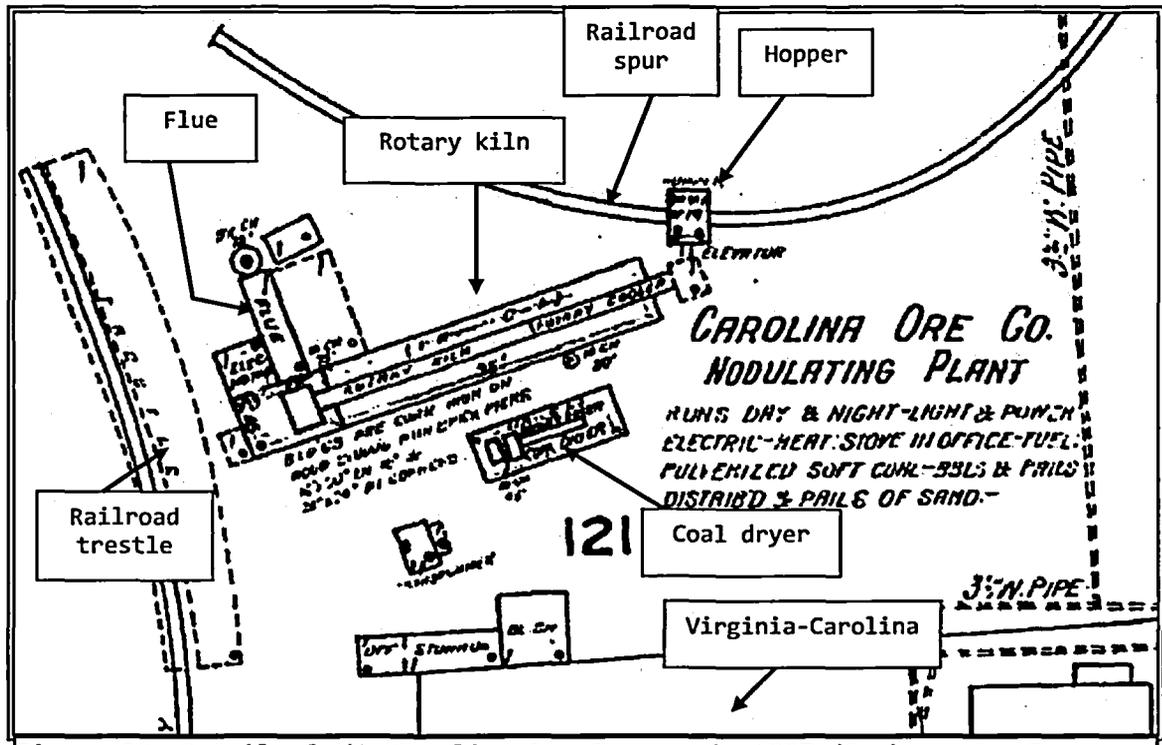

Figure 20: Detail of the Carolina Ore Company in 1917 (Sanborn Map Company 1917).

It should be noted that the 1912 Sanborn map has a note describing what materials the buildings were made of. It says "Buildings of corrugated iron on wood skeleton with 16" x 20" brick pier, from ground to eaves, at every 10', 24" x 24" piers at corners." The structure is made of solid cement, yet the map does not describe any buildings being made of cement. However, if the structure is indeed a foundation then it may not have been considered a separate building. Perhaps the building was not made of cement but the foundation that held the rotary kiln was.

NRHP Evaluation

The final task is to evaluate site 31FY1160** for potential inclusion on the NRHP. The NRHP was created by the National Historic Preservation Act (NHPA 1966, as amended 1992) to be the official list of the nation's significant cultural resources that should be considered for protection. Section 106 says that if a Federal agency's undertaking will have an effect on a NRHP-listed or -eligible property, it must afford the State Historic Preservation Office (and, if necessary, the Advisory Council on Historic Preservation) an opportunity to comment.

Archaeological sites are evaluated based on criteria specified in the U.S. Code of Federal Regulations Title 36, Part 60: *National Register of Historic Places* and *National Register Bulletin 15* (National Park Service [NPS] 1998) describes how to evaluate them. Cultural resources can be defined as significant if they possess integrity of location, design, setting, materials, workmanship, feeling and association, and if they:

- a- Are associated with events that have made a significant contribution to the broad pattern of history; or,
- b- Are associated with the lives of persons significant in the past; or,
- c- Embody the distinctive characteristic of a type, period, or method of construction, or represent the work of a master, possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction; or,
- d- Have yielded, or may be likely to yield, information important in prehistory or history.

Archaeological sites are usually evaluated based on criterion d, information potential. The National Park Service (National Park Service [NPS] 1998:21) gives two requirements for archaeological sites to be eligible under Criterion d:

- 1) The site must have, or have had, information to contribute to our understanding of human history or prehistory, and
- 2) The information must be important.

The data is considered important when it can be applied to a research design that either addresses current data gaps, or supports alternative theories that challenge existing ones. The site must possess "configurations of artifacts, soil strata, structural remains, or other features that make it possible to:

- 1) Test a hypothesis or hypotheses about events, groups, or processes in the past that bear on important research questions in the social or natural sciences or the humanities; or
- 2) Corroborate or amplify currently available information suggesting that a hypothesis is either true or false; or
- 3) Reconstruct the sequence of archaeological cultures for the purpose of identifying and explaining continuities and discontinuities in the archaeological record for a particular area" (NPS 1998:21).

Site 31FY1160** does not have many of the attributes that would make it eligible for listing on the NRHP. For instance, while it does possess integrity of "location" (since it has not been moved), it does not possess integrity of design, setting, materials, workmanship, feeling or association. Also, the structure is actually a part a structure, not an entire structure. The diagram in Figure 15 and the Sanborn maps in Figures 19-20 show it would have had several more parts including a long building that supported or surrounded an iron tube, a "rotary cooler," an engine room, a flue, a railroad trestle, an elevator, and a hopper. It is missing a significant portion of the original rotary kiln so its design is certainly not intact. The industrial setting of the site no longer exists, either. The Sanborn maps show the rotary kiln was surrounded by several other Carolina Ore Company buildings, railroad spur lines, and the Virginia-Carolina Fertilizer Factory. Most or all of the structures and railroads were removed when the industries shut down, and any that remained have probably been destroyed by the construction of US 52. For the same reasons, the integrity of materials, workmanship, feeling, and association of the site no longer exist. Other than the rotary kiln foundation, all of the structures and infrastructure associated with the original industries are gone.

Because the site has no integrity it is not possible to apply any of the NRHP criteria to 31FY1160**. If all or most of the Carolina Ore Company buildings were intact it may have been possible to apply criterion A because it was associated with a broad pattern of history, the industrial development of Winston-Salem. While the company was not directly associated with any famous people, it may have been possible to apply criterion B because several prominent Winston-Salem industrialists/financiers sat on the Board of Directors of the Virginia-Carolina Fertilizer Company, and perhaps the Carolina Ore Company, also. If the complex were intact it might have been possible to apply criterion C because it could have embodied the distinctive architecture and/or arrangement of an early twentieth-century factory. Finally, if it had been intact it could have been possible to apply criterion D to the site. Background research found that not much research has been conducted about twentieth century industries of this type in Winston-Salem. Other industries like the tobacco and textile mills have been studied, but no one has shown much interest in the fertilizer and iron ore nodulization industries. It could be an interesting subject because these industries were apparently quite lucrative. The Virginia-Carolina Fertilizer Company was a major corporation with profits of many millions of dollars and dozens of subsidiary companies. There are few known research questions or hypotheses about these particular industries so some sort of historic context would need to be developed.

Chapter 4: Conclusions and Recommendations

In summary, NCDOT archaeologists identified the remains of a structure (site 31FY1106**) along the east side of US 52 in northern Winston-Salem. Visual examination of the structure and extensive background research concluded that it was most likely a foundation for the rotary kiln at the Carolina Ore Company that operated from circa 1910 to 1924.

While my research could not confirm this theory, it is an educated guess. Unfortunately there is little information available about the Carolina Ore Company. I could not find any photographs of old rotary kilns to compare, but the structure does look like the "bed" of cement kilns shown in several historic photographs. This landscape has undergone substantial physical changes since the early 1900s. The area is at the junction of two major railroads, and the Southern Chemical Company, the Virginia-Carolina Chemical Company, and the Carolina Ore Company have each operated here. The major landscape change was the construction of US 52 that cut a wide path through the middle of the former locations of the industries. All of this activity has probably destroyed most or all of the buildings that were once associated with the rotary kiln.

No additional fieldwork is recommended at this location for several reasons. The first reason is that the proposed improvements to US 52 will not physically impact the structure. It is not threatened with destruction by this road project. Second, an intensive archaeological field survey would not accomplish anything other than perhaps to delineate the extent of the industrial remains in the area. It could possibly identify some structure foundations, old driveways, and possibly old railroad spur lines, but we already have several detailed maps of the factories. Third, the data collected by field survey would be difficult to analyze because the area has doubtlessly been disturbed by the removal of the buildings in the late 1920s, the expansion of the railroads, and the construction of US 52 in the early 1960s. It would be difficult to determine what is intact and what isn't. In a related matter, the dirt is probably contaminated with various industrial chemicals and it is not a good idea to disturb it. For all of these reasons no archaeological field work is recommended.

Site 31FY1160** is recommended ineligible for the NRHP. The area has been disturbed and it is not possible to apply any of the NRHP criteria to the site. The structure is only a part of a larger structure that would have been part of a much larger industrial complex. The attributes necessary in order for a site to be eligible for listing on the NRHP no longer exist at this location. No further work is recommended for the proposed improvements to US 52.

Subject:

Addendum No. 1 to Site Delineation Report/Removal Action Work Plan
Former Virginia-Carolina Chemical Company Winston-Salem Site
Winston-Salem, Forsyth County, North Carolina

Dear Mr. Mallary:

This letter presents an addendum (Addendum No. 1) to the *Site Delineation Work Plan Former Virginia-Carolina Chemical Company Winston-Salem Site, Winston-Salem, Forsyth County, North Carolina* (Work Plan). Revision 1 of the Work Plan was submitted on February 5, 2010. On April 22-23, 2010, ARCADIS collected additional soil samples to delineate arsenic- and lead-containing soils in the vicinity of Removal Area 9. This addendum provides a text summary, tables, and figures that present the new Removal Area 9 data. Please include this addendum as part of the Work Plan for future reference.

Soil Delineation Sampling

A total of 29 samples were collected from 6 soil borings (WS-SB-57 through WS-SB-62) near Removal Area 9. In general, samples were collected from 0-0.5 feet, 0.5-2 feet, and in 2-foot intervals until vertical delineation was achieved or until auger refusal was encountered. Arsenic was detected in one soil sample at a concentration of 24.1 milligrams per kilogram (mg/kg), which exceeds the site-specific action level (SSAL) of 22 mg/kg. Lead was detected in five soil samples from two soil boring locations at concentrations exceeding the SSAL of 270 mg/kg. The maximum arsenic concentration was 24.1 mg/kg, which was measured in the sample collected from soil boring WS-SB-57 at a depth of 0.5 to 2 feet bgs. The maximum lead concentration was 1,420 mg/kg, which was measured in the sample collected from soil boring WS-SB-60 at a depth of 2 to 4 feet bgs. A summary of the soil samples is presented in the attached Table 2-1 addendum. Soil sample analytical results are presented in the attached Table 3-1 addendum. Soil sample locations and results

ARCADIS G&M of North Carolina, Inc.
NC Engineering License # C-1869
NC Surveying License # C-1869

are presented on the revised Figures 2-1 and 3-1, respectively. Revised Figure 4-1A depicts the revised horizontal and vertical soil removal limits at Removal Area 9. Revised Tables 5-1 and 5-2 are also included with updated Removal Area 9 surface area, volume, and tonnage estimations.

Waste Characterization Sampling

Three composite soil samples (WS-WC-22 through WS-WC-24) were analyzed for Toxicity Characteristic Leaching Procedure (TCLP) arsenic and lead during the April 2010 sampling activities in order to characterize the soil for off-site disposal. None the three soil samples contained detectable concentrations of arsenic in the TCLP leachate. Lead was not detected in any of the waste characterization samples at concentrations exceeding the Resource Conservation and Recovery Act (RCRA) standard of 5.0 milligrams per liter (mg/L) for lead. A summary of waste characterization results is presented in the attached Table 3-2 addendum and sample locations are depicted on revised Figure 3-1.

Investigation-Derived Waste Sampling and Disposal

One drum containing soil/debris/personal protective equipment (PPE) was generated during the April 2010 delineation activities at the Site. Investigation-derived waste (IDW) results from the April 2010 delineation activities are presented in the attached Table 3-4 addendum. Based on the laboratory analytical results, the waste was classified as non-hazardous material. Haz-Mat Transportation and Disposal, Inc. transported and disposed of the waste materials at the Allied CMS Landfill in Concord, North Carolina. A copy of the waste manifest is attached.

Field Quality Control Samples

Field quality control samples were collected in order to check the adequacy of equipment decontamination procedures and to allow for the evaluation of potential cross-contamination of samples due to the equipment. Field quality control sample results are presented in the attached Table 3-6 addendum.

ARCADIS

Mr. Ken Mallary
June 22, 2010

If you have any questions or comments, please feel free to contact me at 919.415.2308.

Sincerely,

ARCADIS G&M of North Carolina, Inc.

Matthew T. Pelton, P.E.
Senior Environmental Engineer

Subject: 6/18/10 Weekly Status Report: VCC Winston-Salem, NC

Ken/Tim - This email provides the required weekly report for the VCC-Winston-Salem, NC site. Please let me know if you have any questions or if you need any additional information.

Regards-
Matt Pelton

ACTIVITIES PERFORMED DURING PERIOD

1. Ken Mallary made site visit on June 16th
2. Completed clearing activities on northwest side of highway.
3. Started soil stabilization activities in Removal Areas 3 and 5.
4. Continued soil removal in Removal Area 3, and started soil removal in Removal Area 4.
5. Disconnected utilities in removal areas on northwest side of highway.
6. Started backfill in Removal Areas 3 and 4, adjacent to railroad.
7. Completed pre-excavation topographic survey on northwest side of highway.
8. Performed post-excavation survey of portions of Removal Areas 3, 4, and 5.

Soil Removal Status	
Removal Area	% Complete

11	100%
12	100%
13	100%

ACTIVITIES TO BE PERFORMED DURING NEXT PERIOD

1. Continue soil stabilization activities on northwest side of highway.
2. Continue soil removal activities on northwest side of highway.
3. Continue backfill of completed removal areas on northwest side of highway.

ACTION ITEMS/OTHER

1. None.

Subject: 6/4/10 Weekly Status Report: VCC Winston-Salem, NC

Ken/Tim - This email provides the required weekly report for the VCC-Winston-Salem, NC site. Please let me know if you have any questions or if you need any additional information.

Regards-
Matt Pelton

ACTIVITIES PERFORMED DURING PERIOD

1. Continued site preparation activities.
2. Completed soil removal in Removal Area 9, results of confirmation sample pending.
3. Completed soil removal in Removal Area 13, results of confirmation samples pending.
4. Completed post-excavation topographic survey of Removal Areas 9 and 10.
5. DOT started backfill of Removal Area 10.
6. Started soil removal in Removal Areas 11 and 12.

Subject: Notice of planned sampling at Kerr-McGee Navassa the week of June 14, 2010

Robert,

The EPA is planning to conduct sampling at the Kerr-McGee Superfund Site in Navassa, North Carolina the week of June 14, 2010. Our original plan was to sample soil in ditches and yards across the street from the facility and to sample irrigation wells on the south side of Navassa Creek. These sampling locations are not located on Tronox property.

However, after discussion with EPA's geologist in charge of the sampling, EPA is now planning to bring a small geoprobe rig to sample soil and sediment at the edge of the marsh. The goal of the geoprobe work is to collect data on contaminant distribution and to help EPA's geologists understand the working conditions at the site. This is in preparation for an October sampling event, which will involve a similar geoprobe rig mounted on a "swamp-buggy"-type work platform.

I apologize for such short notice that EPA will be working on Tronox property. As our work schedule firms up, I will keep you posted.

Please let me know if Tronox will send personnel to observe the work, if so, we can try to accommodate the work schedule to their travel plans.

If Tronox is interested in any split samples, please let me know. We will send a copy of the documentation of the work conducted, including copies of reports and photos of the work.

EPA's Athens lab is finalizing the work plan for the June sampling event and I will forward you a draft as soon as it is ready. We welcome and encourage your input to the sampling plan.

Please feel free to contact me with any questions.

Thanks,
Erik

ACTIVITIES TO BE PERFORMED DURING NEXT PERIOD

1. Continue site preparation activities.
2. Continue soil removal activities on southwest side of highway.

ACTION ITEMS/OTHER

1. Based on discussion with Ken Mallary and David Mattison, the soil removal limits along Highway 52 for Removal Areas 11 and 12 will be adjusted by moving the limits down the highway embankment to the toe of the slope to avoid excavation of highway fill material and potential undermining of the highway. The originally mapped limits were drawn on the Removal

Action Work Plan figure 4-1B prior to clearing and site survey, final limits based on this adjustment will be provided in the Final Report. Similar adjustments may also be made in other removal areas if the original limits extend above the toe of the highway embankment.

Subject:

CERCLA Soil Removal Project Near Unnamed Intermittent Stream
Winston-Salem, North Carolina

Dear Mr. Thomas:

Thank you for talking with Ken Mallery of United States Environmental Protection Agency (USEPA), David Mattison of North Carolina Department of Environment and Natural Resources (NCDENR), me yesterday regarding the permitting requirements for soil removal activities to be conducted along an unnamed intermittent stream in Winston-Salem, NC. As requested, this letter provides information related to this project in support of work being conducted in accordance with the general requirements of Nationwide Permit (38), but without formal pre-construction notification (PCN) being made to the U.S. Army Corps of Engineers (USACE).

The project site is located at 3303 N. Glenn Avenue in Winston-Salem, Forsyth County, NC. Attached Figure 1-1 shows the location of the Site on the USGS quad maps for Walkertown and Winston-Salem East, North Carolina. Attached Figure 1-2 shows Bowen Branch located north of the project area. Attached Figure 1-3 shows the current and historical site features. The site is a former fertilizer manufacturing site with arsenic and lead impacts in the soil, this project involves the excavation and offsite disposal of these impacted soils. Soil removal activities are being conducted on behalf of Exxon Mobil Environmental Services Company (EMES) in accordance with the USEPA-approved *Site Delineation Report and Removal Action Work Plan, Revision 1* (ARCADIS, February 2010) and per the Administrative Order on Consent issued by USEPA.

The AOC Docket # for the Site is CERCLA-04-2010-3763 with an effective date of March 30, 2010. Mr. Ken Mallery is the Remedial Project Manager (RPM) for the project and can be reached at 404-562-8802. Mr. Tim Neal is the On-Scene Coordinator (OSC) for the project and can be reached at 404-562-8796.

ARCADIS G&M of North Carolina, Inc.
NC Engineering License # C-1869
NC Surveying License # C-1869

ExxonMobil has entered into the AOC with USEPA to address the arsenic and lead impacts. Approximately 30,000 tons of impacted soil exists at the Site and will be removed during the removal action. Soil removal areas and depths are shown on attached Figures 4-1A and 4-1B. The intermittent stream in question runs through Removal Areas 1 and 2 on Figure 4-1A.

As referenced above, this project is being conducted under USEPA's CERCLA program. As described in 40 CFR Part 300, Section 400, Paragraph (e), CERCLA projects are exempt from all federal, state, and local permits. Furthermore, as described in the Nationwide Permit (38) itself, "Activities undertaken entirely on a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) site by Authority of CERCLA as approved or required by EPA, are not required to obtain permits under Section 404 of the Clean Water Act or Section 10 of the Rivers and Harbors Act." Therefore, a Nationwide Permit is not required for this project. However, because this project includes work along the banks, and potentially within the channel, of the identified intermittent stream to remove impacted soils and restore the Site, EMES intends to meet the substantive requirements of the NWP 38 permit.

Erosion control measures, including silt fence, check dams, etc., will be used as needed to protect the stream and prevent the erosion of soils during storm events. Following soil removal the stream banks will be graded and restored to prevent future erosion. Restoration may include grading the banks to 2H:1V or 3H:1V slopes, placement of erosion control fabric along the banks, and seeding to establish a vegetative cover.

We appreciate your assistance with our earlier discussion. If you need any additional information please let me know. You may reach me at 919.415.2308.

Sincerely,

ARCADIS

Subject: 5/14/10 Weekly Status Report: VCC Winston-Salem, NC

Ken/Tim - This email provides the required weekly report for the VCC-Winston-Salem, NC site. Please let me know if you have any questions or if you need any additional information.

Regards-
Matt Pelton

ACTIVITIES PERFORMED DURING PERIOD

1. Submitted Entact SOP to EPA, HASP is being revised and will be submitted next week.
2. Completed and signed contract with Entact.
3. Attended meetings with property owners from Waste Management and Atlantic Scrap, as well as with DOT and their contractor, to discuss access logistics for the project.
4. Construction planning, procurement, and logistics.

ACTIVITIES TO BE PERFORMED DURING NEXT PERIOD

1. Submit Entact HASP to EPA.
2. Hold Project Kickoff meeting on Monday, May 17th.
3. Begin mobilization activities.
4. Begin site preparation activities.

ACTION ITEMS/OTHER

1. None.

END OF REPORT

1.0 INTRODUCTION

This Site Operations Plan (SOP) for the former Virginia-Carolina Chemical Corporation (VCC) Winston-Salem Site (the Site) in Winston-Salem, North Carolina, has been developed by ENTACT to provide the Site operational controls and procedures that will be used to implement the approved soil Removal Action (RA) as outlined in the 2010 Request for Proposal.

The objective of the soil RA is to remove soils that have been found to contain arsenic and/or lead at levels over the Site-specific action levels (SSALs), as described in the Arcadis February 2010 *Site Delineation Report and Removal Action Work Plan (SDR/RAWP)*.

The following sections of this document are organized as follows:

- Section 1 present the Site location and background information, the chemicals of concern at the Site and the performance standards governing the Removal Action;
- Section 2 presents the Site operations procedures detailing the soil removal, management, and handling procedures of the materials;
- Section 3 presents the Transport and Disposal Plan.
- Section 4 presents the Work Documents to be submitted during and following the Removal Action.
- Section 5 present the Project Schedule

The Site-Specific Health and Safety Plan (HASP), also prepared by ENTACT will be submitted concurrently with the SOP under a separate cover.

1.1 SITE LOCATION AND DESCRIPTION

The Site is located near the intersection of Indiana Avenue and two separate branches of the Norfolk Southern railroad in Winston-Salem, Forsyth County, North Carolina; as shown on the United States Geological Survey (USGS) 7.5-minute quadrangle maps for Walkertown and Winston-Salem East, North Carolina. The property that contains most of the Winston-Salem site has a street address of 3301 Glenn Avenue; however, the former plant site is located at the far southern end of this property closer to Indiana Avenue between two branches of the Norfolk Southern Railroad. The Site is bisected from northwest to southeast by the US 52 / SR 8 right-of-way (ROW).

1.2 SITE BACKGROUND

Historically, this Site was used as a phosphate fertilizer production facility until 1927. The north and central portions of the Site are the probable location of the main operations associated with the former phosphate fertilizer plant. Debris and impacted soil in these areas are the subject of this removal action. The Site consists of approximately 7.7 acres of mostly undeveloped land bounded to the east by the Norfolk Southern railway. A North Carolina Department of Transportation (NCDOT) transportation corridor and right-of-way for Highway 52/SR 8 bifurcates the site. Land to the north of the NCDOT corridor is owned by Atlantic Scrap and Processing LLC. Land to the south of the NCDOT corridor is owned by Waste Management of

the Carolinas. Access to the site is provided by gravel access roads from the Atlantic Scrap and Waste Management properties. The approximate geographical location of the center of the Site is at 36.1270° North latitude and 80.2342° West longitude (North American Datum of 1983 [NAD83]).

Historical information indicates that a fertilizer plant was constructed at the Site by Southern Chemical Company between 1895 and 1900, and was continuously operated through 1927. Virginia-Carolina Chemical Company acquired the plant from Southern Chemical Company in 1902. The Site has undergone little to no development since the VCC operations ceased and is mainly undeveloped and heavily vegetated.

Site investigation activities conducted on behalf of EMES and other parties indicate that elevated concentrations of arsenic and lead are present in soil in several areas.

1.3 SELECTED REMOVAL ACTION CRITERIA

The objective for the RA at the Site is to remove soils with lead and/or arsenic concentrations exceeding the SSALs of 270 milligrams per kilogram (mg/kg) for lead and 22 mg/kg for arsenic from thirteen (13) distinct removal areas located on four properties covering a total area of approximately 3.65 acres. Based on information provided by ARCADIS, the total volume of soils requiring removal and disposal is estimated to be 31,000 tons.

Soils that contain Toxicity Characteristic Leaching Procedure (TCLP) arsenic and lead concentrations below 5 milligrams per liter (mg/L) shall be disposed of off-site at an EMES-approved, Subtitle D land disposal facility. Soil that contains TCLP arsenic or lead concentrations at or above 5 mg/L shall be stabilized on site prior to disposal at an off-site, EMES-approved, Subtitle D land disposal facility. In the event that stabilization is not effective in reducing the leachable concentrations of arsenic and lead to below 5 mg/L, these materials shall be disposed of off-site at an EMES-approved, Subtitle C land disposal facility. Composite samples of the stabilized materials will be collected and analyzed to ensure that leachable concentrations of arsenic and lead are below 5 mg/L prior to off-site disposal in a Subtitle D facility. Soil removal areas where TCLP lead concentrations exceed 5 mg/L are illustrated in Figure 3; existing data indicates that TCLP concentrations of arsenic were not detected above 5 mg/L.

Upon completion of excavation activities to the initial target depths illustrated in Figure 3, the Engineer shall collect confirmation soil samples at the base of the excavation areas to determine the concentrations of arsenic and lead. Confirmation soil samples will be screened in the field by the Engineer using a portable X-ray fluorescence (XRF) analyzer. Confirmation soil samples will also be submitted to the laboratory and analyzed on an expedited basis for confirmation of the field screening results. In the event that confirmation soil samples contain arsenic and/or lead above the SSALs, additional soil excavation and sampling will be performed. Excavation will continue until confirmation soil sample results for arsenic and lead are below the SSALs, or the base of the excavation reaches the groundwater table. The RAC shall be notified of the confirmation soil sample results within 5 business days of sample collection. Field screening and confirmation soil sampling will be performed by the Engineer, and laboratory analyses will be conducted by an EMES-approved laboratory. The use of field screening and laboratory

analyses to guide excavation activities is described in the *Site Delineation Report/Removal Action Work Plan, Former VCC Winston-Salem Site – Winston-Salem, North Carolina (SDR/RAWP)* (ARCADIS, January 2010).

2.0 EXCAVATION AND HANDLING PROCEDURES

The excavation and handling procedures have been designed to ensure that all steps of the RA meet all applicable regulations for the management and disposal of contaminated soils.

2.1 PRE-EXCAVATION ACTIVITIES

2.1.1 Permits

All required federal, state and local permits and approvals will be obtained prior to implementation of the RA. ENTACT will contact the following Agencies, to obtain the permits necessary prior to initiation of the work:

- City of Winston-Salem (Grading, NPDES)

2.1.2 Stormwater Management Plan

Stormwater control measures will be implemented before the management of material is initiated at the Site to minimize the volume of water accumulated in soil areas containing elevated metals concentrations. Controlling and minimizing run-on to active work areas will be accomplished through the proper design, construction and maintenance of soil berms. Silt fence or other appropriate measures will be implemented to supplement and protect the soil berms.

Soil berms will be constructed of clean backfill soils, outside of the excavation limits, to prevent cross-contamination of soils to remain onsite. For Removal Areas within the NCDOT ROW, an appropriate quantity of clean backfill soil will be needed from the DOT Contractor to construct the soil berms. In areas where slopes adjacent to the removal areas will not allow for additional soil placement, such as along the western limits of Removal Areas 1 and 5, silt fence or other measures may be utilized to divert the maximum amount of stormwater away from the Removal Areas.

Soil berms may also be constructed within the excavation limits to segregate stormwater that collects in previously excavated areas awaiting confirmation sample results from stormwater that has contacted impacted soils.

Water contacting impacted soils will not be discharged. Contact water may be utilized as dust control for soils targeted for removal, but will not come in contact with soils that are to remain onsite. Contact water will be handled with dedicated equipment that is not used for handling clean water. Any remaining contact water will be collected, sampled, and characterized prior to off-Site disposal. Collection devices may range from 55 gallon drums to poly tanks or totes to 21,000 gallon frac tanks depending on the quantity of water to be handled.

If excavation below the groundwater table becomes necessary, contact water will be handled in a similar manner as described above.

Water that does not come into contact with disturbed soils will be routed to the appropriate drainage feature at or near the Site.

2.1.3 Erosion and Sedimentation Control Plan

Erosion control measures will be implemented in areas as needed to prevent accelerated erosion of areas subject to removal and to prevent excess sedimentation in drainage pathways in accordance with the Erosion and Sedimentation Control Plan (ESCP) prepared by ARCADIS on behalf of EMES. These measures will include use of silt fencing and other controls to prevent impacted soils from being transported to clean areas or off-Site and contain sedimentation and address disposal of contained/pooled water on Removal Areas and temporary staging areas. These measures will be inspected, maintained and upgraded daily and after any rainfall during Site removal activities and until a stable condition has been reached on the restored areas. Inspections will be documented in a log book and on the proper forms provided in the ESCP.

2.1.4 Dust Control and Monitoring Plan

ENTACT will perform excavation activities in a manner to control dust emissions to protect on-Site workers and the public from potential exposure to dust. Site preparations will include positioning and implementing dust suppression and engineering control measures to ensure that air emissions are maintained at "no visible emissions" at the Site perimeter during the construction phase of the RA.

ENTACT will utilize water trucks with a pump and hose system. As a preemptive measure during any extended dry weather periods, ENTACT may reduce dust issues by pre-soaking Removal Areas up to two days prior to beginning removal. This method simulates a rain event creating moist soil that will not create dusty conditions. Also, if dusty conditions arise, the water truck will have a spray bar or larger spray device which can be used to spray large areas by driving the truck over such areas as well as a hose connection to be sprayed directly on potential dust areas. This method has been proven to be highly effective in controlling dust in similar type projects where mitigation of potential fugitive dust generation is a priority. Arrangements will be made for a connection to the local, potable water supply to provide clean water for dust control measures.

Other dust suppression methods utilized during the removal actions may consist of water misting in excavation areas using high-pressure, low-volume sprayers. These misters will be hand operated by ENTACT personnel and/or situated as stationary devices directed at specific areas having the potential to produce dust.

Real time monitoring for respirable dust will be performed using a field-portable monitor that displays airborne dust concentrations immediately and continuously on a digital LCD screen in units of milligrams per cubic meter of air (mg/m³) with a data logging feature. These units use optical light scattering and has a built-in power source. These units are sometimes referred to as real-time aerosol monitors (RAM) or personal dataRAM (PDR.) Calibration of the RAM will be

in accordance with the manufacturer's instructions. Monitoring will be performed as needed, such as for newly detected particulates which were not previously detected or anticipated. Two PDR units will be utilized at each active excavation area, one downwind of work area and one downwind at the site perimeter. Readings above 0.5 mg/m^3 at the work area, or 0.15 mg/m^3 at the site perimeter, will require additional dust suppression. Dust suppression may be accomplished by slowing or stopping the work activity, increased application of water and the use of less aggressive techniques for mixing and excavating soils. Speed limits on the site will be set to control generation of road dust. Note that the standard site work practice is for dust suppression to begin whenever dust is visible.

NIOSH method samples will be collected using air sampling pumps with pre-weighed MCE filter (NIOSH Method 0500 and 7300) and submitted to Galson Laboratory for analysis of total dust, lead, and arsenic. Each sampling location will also be monitored for total particulates in real time using a MIE DataRAM. Samples will be collected from the following general locations:

- 1 downwind of the excavation, soil stabilization and soil staging area
- 1 upwind of site perimeter
- 1 downwind of site perimeter (note that perimeter monitoring may also be performed by the Engineer to confirm dust levels at the perimeter of the Site)
- 1 personal monitor on personnel working at the site.

Samples will be collected until 5 consecutive days of results have been obtained that verify the AL was not exceeded. During the first 10 work days of NIOSH method sampling, sample media will be shipped priority overnight each day with a requested 24 hour turnaround time from the laboratory. After 5 consecutive days of results below the AL, NIOSH method sampling will continue at a rate of 20% (1 sample every 5 workdays) for all removal activities. NIOSH method sample media will be shipped every other day with standard turnaround time requested from the laboratory. If at any time, TWA ALs are exceeded, 100% NIOSH method sampling with 24 hour turnaround will be instituted until 5 consecutive days of results below the AL are achieved. Prior to starting soil removal, a background NIOSH samples will be collected to establish appropriate background readings for the site. Action Levels for TWA NIOSH method sampling is 0.005 mg/m^3 for Arsenic and 0.030 mg/m^3 for Lead at the work area and 0.0015 mg/m^3 for both constituents at the site perimeter.

2.1.5 Noise Control Plan

Work involving the use of mechanized equipment will be conducted between 7:00 a.m. and 5:00 p.m. with additional hours as needed, not to exceed the available daylight. In the case that vacuum excavation is implemented, equipment will be staged in areas to minimize noise to adjacent off-Site interests and monitoring equipment will be used to determine employee exposure levels and potential off-Site impact. Alternative equipment will be used if unacceptable noise levels occur. Refer to Section 5.2.4 of the Site-specific HASP.

2.1.6 Protection of Subsurface Utilities and Other Obstructions

Prior to beginning heavy equipment operations, ENTACT will file utility line locate requests with the North Carolina One Call Center (NCOCC) for underground utilities at least 72 hours before onsite activities are started. Locate Ticket information will be provided to EMES before initiating on-site activities. Locate Tickets will be updated every 13 business days, as required, throughout the project, until all intrusive activities are completed. The locations of these lines will be confirmed by a private utility contractor and through visual inspections of nearby manholes, water meters, catch basins, utility poles, pedestals, markers and other above ground utility indicators. ENTACT will identify subsurface utilities within the Removal Areas prior to excavation. Existing underground power lines that prevent remedial activities may be relocated prior to excavation activities. The affected property owners will be provided notice at least a minimum of 24 hours prior to the interruption in service due to any temporary relocation of subsurface utilities.

Caution and awareness of power lines and other utility services that remain in place will be part of the daily work health and safety meetings if the planned activities require working in the proximity of these lines.

Compliance with the Subsurface Utility Checklist identified in EMES's OIMS requirements will be verified and documented in a log book maintained onsite. Locations and elevations subsurface utilities that are encountered within the Removal Areas will be documented via surveying.

2.1.7 Survey Control

An independent licensed Land Surveyor in the State of North Carolina will perform detailed horizontal and vertical control surveys to determine: the limits of the removal areas and existing grade elevations at a grid spacing of 25 feet; Elevations at the base of the excavations prior to backfilling at a grid spacing of 25 feet; locations and elevations of subsurface utilities within the Removal Areas; limits of the demarcation barrier placed over impacted soils left in place; and finish grade elevations and horizontal extent of excavations. Additional survey shots will be obtained, as needed, to document changes in elevation or other site features not aligned with the 25 foot grid spacing.

Prior to initiating removal and/or stabilization activities, a coordinate grid system (CGS) will be established over the delineated removal area in order to provide a coordinate system for tracking excavation activity in the field. The CGS will employ square grids of approximately 25 feet by 25 feet superimposed over the Removal areas of the Site. This coordinate system will be used to provide benchmark locations and reference markers during excavation for documentation. Record Drawings will be kept current to identify the results of remedial action activities.

A set of deliverables will be submitted to the Engineer upon completion of each of the three phases of work: Pre-Excavation; Base Excavation (including demarcation liner); and Post-Excavation. Each deliverable set will consist of three paper copies that are signed and sealed by a North Carolina licensed Land Surveyor and one electronic copy.

2.1.8 Tree and Brush Removal

Following set up of the work zones, the Removal Areas will be prepared for excavation by removing the above ground trees and brush. The above ground portions of the trees, to include the tree trunks and branches, etc., that is not in direct contact with the soil may be handled to prevent contact with impacted soils, moved out of the Removal Area, and chipped for reuse onsite during restoration activities or hauled offsite and disposed of or reused. A Feller-buncher, or excavator with grapple will be employed to safely and efficiently remove the trees and limit contact with the impacted soils. Wood chips to remain onsite will be staged outside of the Removal Areas, in an area acceptable to the property owner, until needed for restoration. The below ground portions of the trees and brush, including the stump and root mass, will be combined with the impacted soil and disposed of off-Site with the excavated soil.

2.1.9 Traffic Management Plan

ENTACT will control vehicular traffic to ensure activities are performed safely and efficiently. All excavated material will be transported via surface streets directly to the off-Site disposal facility. Proposed traffic routes will be determined and based on sequencing of removal methods and Removal Areas to be remediated. Sequencing of removal areas will be done in a manner that allows for safe and efficient haul routes for disposal trucks and also minimizes potential cross contamination of clean removal areas. In order to minimize disturbance to the property owners daily operations, ENTACT will plan and schedule truck activity to decrease and eliminate demurrage time to the best of our ability. A journey management plan (JMP) will be completed by the Contractor before work begins and will be updated or revised as necessary for on-going work activities.

Site access and traffic management will be coordinated with each of the property owners. Truck routes will be adequately marked with signs, traffic cones, arrows, or other means to ensure clear and concise directions for all traffic entering and leaving the Site. Trucks will enter the Site from Glenn Ave and proceed to the appropriate staging area to queue for loadout. Staging areas will be delineated to reduce congestion and limit any disruption to the property owners. Trucks will be routed such that backing will be reduced or eliminated, if possible.

Escort vehicles may be utilized to lead trucks through the Site to the appropriate staging area or Removal Area. Loaded trucks will exit the Site immediately following proper manifesting, documentation, placarding, and visual inspection for cleanliness. Transport vehicle traffic will leave the Site onto Glenn Ave. on the west side of the Site. A flagman may be provided at Glenn Ave, if necessary, to allow transport vehicles to safely enter the flow of traffic. Transport vehicles will utilize city or state paved roads to transport waste materials to the appropriate off-Site disposal facility in accordance with the JMP.

A Site speed limit of 15 mph will be established and enforced to minimize dust generation. All trucks hauling excavated soil will be tarped, manifested and display the appropriate placards during transportation.

During the course of the project, as the overlapping DOT project progresses, access may be available to the Site directly from US-52. If this situation develops, the appropriate coordination with all parties will be necessary to ensure the continued safety of all personnel.

2.1.10 Coordination with Billboard Owner

ENTACT will coordinate the applicable Site work activities with Fairway Outdoor Advertising personnel to allow removal and replacement of the foundation, utilities, and billboard at the Northwest intersection of US-52 and the NSRR.

2.1.11 Contingency Plan

All materials brought to the Site will be in appropriate and labeled containers. Materials will be stored in the designated staging area and protected from damage and weather. Gasoline, diesel fuel, and other oils and hazardous materials will be stored in double-wall tanks, secondary containments, and/or other appropriate storage areas such as flammable storage cabinets.

Should an unexpected need arise due to incident or other emergency, during or after normal work hours, the appropriate parties, as described and listed in the SSHASP will be notified.

Emergency vehicles will be met by an escort vehicle at Glenn Ave and led along the normal truck route through the Site to ensure timely response and avoid confusion with the operations of the property owners.

Emergency evacuation procedures will be dependent on the nature and severity of the emergency, location of the hazards, wind direction, and other access restrictions and constraints. Generally, the muster area will be the office trailer/support zone with the Site entrance on Glenn Ave as the alternative. If access to these areas is deemed unsafe, the alternative muster point will be the RR parking lot at Liberty Ave.

Emergency contact personnel are listed in the SSHASP. This contact list will also be posted in the office/support trailer along with maps and directions to the nearest hospital.

2.2 MOBILIZATION AND SITE PREPARATION

2.2.1 Logistical Support

Prior to full-scale mobilization to the Site, ENTACT will perform various logistical preparation activities to ensure an efficient startup of field activities. Logistical preparation activities to be performed include, but are not limited to, the following:

- Arrange for Delivery of Equipment, Supplies, and Materials;
- Confirm Backfill Source(s);
- Coordinate Efforts with Subcontractors;
- Establish Transportation Routes;
- Coordinate Schedule with Landfill

- Contact Local Property Owners, Officials, Agencies, Hospitals, etc., as necessary.

Support Facilities

ENTACT will mobilize the necessary project personnel and equipment to the Site to accomplish the scope of work. An administrative office structure will be established in the support zone and will have the facilities to allow for direction of Site operations, telephone and facsimile communications, a controlled environment for computer equipment, and a point of contact location. Sanitary and wash facilities will be provided in the support zones.

2.2.2 Pre-Construction Meeting with Property Owner and Engineer

ARCADIS will obtain property access agreements from the property owners prior to the commencement of remedial activities. ENTACT will schedule and attend a pre-construction meeting with the Engineer and the property owner prior to the start of work. During the meeting, ENTACT will describe work activities, health and safety, schedule, service relocation and interruption, and provide management contact information in the event an issue arises outside of working hours. ENTACT will also perform a walk-through of the property at this time with the owners further discussing the work and fielding any questions or concerns.

2.2.3 Pre-Excavation Survey and Photo/Video Documentation

A pre-existing conditions inventory will be performed at each property to establish the restoration requirements for the property owners. The inventory will include a record of Site vegetation, personal property, fencing and other pertinent information. The inventory will include pre-restoration photos and/or video of the property and the vegetation to be removed and replaced. Copies of the documentation will be provided to the Engineer before work begins. All changes to existing conditions will be information documented in a Land Restoration Agreement for each property. The Land Restoration Agreement is an ENTACT agreement that documents changes or modifications to the restoration of the property to ensure that ENTACT and the owner are in agreement on the terms of restoration.

The pre-excavation survey will be performed by an independent licensed Land Surveyor in the State of North Carolina. Copies of the survey will be provided in both paper and electronic format. In order to compress the project schedule and avoid delays to the adjacent DOT project, excavation of the initial Removal Areas will proceed following submittal of the survey crew field notes to the engineer with the formal submittal of the pre-excavation survey deliverables within 5 business days of field survey completion.

2.2.4 Site Security Plan

ENTACT will implement Site security prior to soil excavation activities being performed. This will entail placement of orange safety fence, chain-link fence, cones, caution tape, or other suitable demarcation device in all areas surrounding the active Removal Area, other work areas and material staging areas that would not affect the process of excavation and load-out. The work area perimeter will be delineated with orange safety fencing. Warning signs will be placed at 50 ft intervals to discourage entry by unauthorized persons. The areas will be prepared by

removing or relocating any movable objects (fences, debris, temporary structures, etc.) that may inhibit the excavation process. Security at these areas would be upgraded at the end of the day by placing the fence in all remaining open areas. Security devices will be monitored throughout the shift by on-site personnel and repaired, replaced, or upgraded as needed.

Additional fencing or other warning devices may be needed on the DOT right-of-way line to further delineate and separate activities of the various parties sharing the Site.

A security guard may be present at the work area for all off-work hours in order to patrol equipment areas and work areas and prevent access to the Site.

2.3 EXCAVATION AND MATERIAL HANDLING ACTIVITIES

The Removal Areas to be addressed have been identified by ARCADIS during previous investigations. Upon completion of preparation activities, ENTACT will begin soil removal activities at the designated locations beginning with Removal Area 9. Sequencing of removal areas will be done in a manner that allows for safe and efficient haul routes for disposal trucks and also minimizes potential cross contamination of clean removal areas. ENTACT has prepared a tentative project schedule showing actual soil removal activities.

Excavation at each Removal Area will be performed to the lines and grades as shown in the RAWP and as directed by engineer. An X-Ray Fluorescence Analyzer (XRF) will be used by ARCADIS as a screening tool to determine whether or not the initial recommended depth has successfully met the performance criteria. If XRF confirmatory soil analysis determines the presence of lead or arsenic in concentrations exceeding the SSALs, the excavation will proceed in 0.5-foot increments and re-screened. Excavation will continue until either the cleanup goal has been reached or the maximum depth has been attained. In the event that the maximum depth is reached and lead or arsenic concentrations still exceed the cleanup goal, a visible marker barrier will be installed on the excavation floor prior to initiation of backfill operations.

Soil sampling will be performed by ARCADIS upon completion of excavation to the initial depths identified. In the event that soil samples contain arsenic and/or lead above SSALs, additional rounds of soil excavation and sampling will be performed until soil sample results do not contain arsenic or lead above SSALs or additional excavation is not possible due to the infiltration of groundwater or sloping requirements or constraints. Prior to backfilling the excavations, ARCADIS will perform on-bottom confirmation soil sampling and provide the testing results within 5 business days of sample collection.

To ensure the integrity of existing structures, the slope of the sidewalls of the excavations adjacent to these features will be a minimum of 1:2 (vertical to horizontal). A structural analysis will be performed prior to the start of work to determine if less aggressive sloping is necessary. The structural analysis will be certified by a Professional Engineer registered in the State of North Carolina. If any sloping/benching is required outside of excavation limits, soils removed from outside the excavation limits will be used as fill in the same removal area.

Standard excavation equipment such as excavators, loaders, and dozers will be utilized during the removal activities. Specialty equipment and hand excavation will be implemented within 2.5

feet of marked underground utilities and other areas that require delicate removal. A track-mounted excavator will be utilized to achieve excavation bottom grades. The impacted soil will be loaded directly into on-road haul trucks for off-site disposal whenever possible. To avoid driving on impacted soils with on-road haul trucks, some Removal Areas will require one excavator to cut to grade and relay the material to a second excavator loading the on-road haul trucks. An on-site haul truck may be utilized to relay material for loadout.

2.4 SOIL STABILIZATION

Soils to be excavated from portions of Removal Area 3 and Removal Area 5 will require stabilization prior to off-Site disposal to reduce TCLP lead concentrations below 5 mg/L. EnviroBlend 90/10 will be mixed in at a rate of 3% by weight of existing soils to be stabilized. Stabilization will be performed in 200 Ton batches to ensure uniform blending of the stabilization agent and the soils. A representative composite sample of the stabilized soils will be provided to engineer for every 600 Tons of treated soil. Prior to removal of treated soils off-Site, ARCADIS will provide the testing results within 7 business days of sample collection to confirm that TCLP lead and arsenic concentrations are below 5 mg/L.

Based on the relatively small volume of reagent expected to be needed, the EnviroBlend 90/10 will be packaged and delivered to the site in 2,000# supersacks, staged in the support zone and delivered to the mixing area via wheel loader with forks. A 2-3 day supply of reagent will be staged and available for use. Additional deliveries will be scheduled to avoid delays, but reduce the amount of product stored at the site. Proper dispersion of the reagent can effectively be accomplished by adding the appropriate quantity of 2,000# sacks for a given excavation area/mixing batch.

As an example: for RA5, approximately 800sf of surface area, excavated 4ft deep will yield 200 tons of soil. For a 3% by weight ratio, 6 each 2,000# sacks of Enviroblend 90/10 will be mixed into this batch size. For improved blending efficiency, a single sack will be spread over the mixing batch every 33Tons. Based on an excavator bucket capacity of 4Tons, 8 buckets of soils will be placed onto the mixing pad followed by 1 sack of EnviroBlend 90/10. This process will continue 6 times until 200Tons of soil and 6Tons of EnviroBlend 90/10 are on the mixing pad. This recipe will be blended further with the excavator bucket to ensure all of the soil is treated with reagent. The mixed soil will then be transferred from the mixing pad to the adjacent staging area. Three 200Ton batches will be staged together as a 600Ton sample batch and covered with visqueen sheeting until laboratory analysis has confirmed the TCLP for lead and arsenic to be less than 5mg/L. In the event that a TCLP sample fails following the initial mixing, the sample batch may be re-blended to ensure thorough EnviroBlend distribution and resampled. Based on the results of the sampling events and the effectiveness of the stabilization process, the batch may then be treated with additional reagent and resampled or disposed of at the Subtitle C Landfill.

The stabilization area, including the mixing area and the stockpile area, will be setup within the footprint of the TCLP lead impacted material. Soil to be stabilized will be relayed to mixing area with excavators or trucks without impacting the soils that do not require stabilization. Stockpiled soil will be covered with visqueen at the end of each shift for weather protection and dust control.

2.5 SITE RESTORATION

After receiving confirmation that the cleanup criteria have been met, Removal Areas will be backfilled with clean general fill and/or topsoil to the original property conditions. The backfill materials will have been previously sampled to ensure compliance with the Specifications. Fill materials will be placed and graded to pre-remedial contours or better to provide for optimal drainage. Temporarily relocated appurtenances will be reinstalled following soil removal activities.

After preparation of the excavation floor, backfill will be placed in loose lifts, and if necessary, compacted by mechanical methods. In areas outside of the NS ROW, general fill will be placed in the excavation up to 6-inches below the original grade. If necessary, the surface of the general fill will be loosened in preparation for placement of the topsoil. Topsoil will be evenly spread up to original grade. For areas within the NS ROW, clean fill will be placed to original grade and compacted to NS specifications. Geotechnical and analytical test results for the backfill and topsoil materials will be submitted to the engineer for approval prior to delivery of the materials to the site.

Following placement of topsoil, the areas will be revegetated by planting seed. Fertilizer will be applied, if necessary, to the topsoil prior to, or in conjunction with, the seed. Seeded areas will be watered, as needed, to ensure establishment. ENTACT will guarantee all installed vegetation for a period of one year. Seed tags, and application and maintenance instructions for all seed and fertilizer materials will be submitted to the engineer prior to delivery of the materials to the site.

2.6 EQUIPMENT CLEANING PROCEDURES

The first line of defense in prevention of tracking soil is to keep the vehicle tires clean by maintaining clean access roads and ensuring all vehicles remain on the clean roads. A tracking pad, consisting of a 12' wide x 100' long area covered with 2-3" course aggregate, will be constructed along the site exit roads. The purpose of this tracking pad is to shake any loose soil off of the vehicle tires prior to exiting the site. The aggregate surface will be regularly turned over to maintain a clean running surface.

All vehicles will be inspected prior to leaving the site to prevent tracking of site soils onto public roads. A portable truck wash pad will be setup to power wash truck tires, if needed. A skid steer loader equipped with a power broom attachment will be available to broom clean impervious road surfaces, if needed.

For equipment and materials being transferred from the work area subject to impacted soil excavation, a visual inspection will be performed. Any visible materials or debris will be removed and disposed of in a manner consistent with the materials being excavated from the area. EMES's representative will be given the opportunity to inspect each piece prior to removal from the work area.

Equipment leaving the site will be decontaminated prior to demobilization. Dry decontamination methods, using shovel, brooms, and scrapers, will be implemented for all equipment. Wet

decontamination methods may be needed for equipment handling impacted materials. A portable truck wash pad will be available to contain the water spray utilized during wet decontamination. All rinse water will be collected and handled consistent with the other impacted waters onsite.

2.7 DEMOBILIZATION

Upon completion of the removal activities, a Pre-final Inspection will be scheduled to review and inspect the removal action work completed. The purpose of the inspection is to determine whether all aspects of the RAWP have been implemented at the Site, and whether the RA meets the performance standards and is in compliance with all applicable federal, state, and local regulations and requirements.

Upon completion of all Site activities, all temporary construction facilities and utilities will be removed or disconnected. All trash, debris, and extra soil shall be removed from the Site. Temporary safety fences will also be removed at this time.

3.0 TRANSPORT AND DISPOSAL

This section describes the procedures to be implemented for the off-Site transportation and disposal of waste materials to be disposed off-Site. The Site is located in back property of two active facilities with limited area for truck staging. The Site logistics for managing truck traffic will be determined by a visual inspection of the Site, discussion with the property owners, and assessment of the available access, prior to mobilization. Excavated material will be placed into trucks for transport to the designated landfill. Trucks will be loaded by either a loader or excavator. In order to minimize disturbance and impact to the property owners, ENTACT will plan and schedule Removal Areas to reduce truck traffic.

3.1 CONTAINERS AND METHODS FOR TRANSPORT

All waste stream materials will be transported from the Site by tandem truck, tractor-trailer, roll-off box, or similar truck transport system. Open top trailers will be covered with a suitable tarpaulin prior to leaving the Site to prevent wind dispersal of waste materials. Neither free liquids nor saturated soils will be placed in truck beds. Loading of trucks will not be performed during heavy rain events. Decontamination water or dust suppression water requiring off-Site disposal will be containerized in a temporary tank for transport or will be transported by a vacuum equipped transport vehicle.

Trucks utilized for transport of impacted soils will be inspected, and decontaminated as needed, prior to hauling non-impacted materials such as clean fill and topsoil. Decontamination / inspection reports will be completed for any trucks that fit this description and for all trucks hauling impacted soils at the conclusion of each trucks service at the Site.

3.2 EQUIPMENT AND CONTAINERS FOR LOADING

The transportation vehicles will enter the Site at the entrance/exit locations on Glenn Ave. Transport vehicles will proceed to the excavation area where waste materials will be loaded into the tandem trucks, roll-off boxes or tractor-trailers with loaders and trackhoes. Vehicles will not be loaded in excess of the approved axle rating of the transport vehicle and care will be taken to prevent the contamination of transport vehicles during load out. Dust suppression systems, consisting of water misting and spraying devices, will be used, if necessary, to prevent airborne dust emissions from leaving the load out area. Upon the completion of load out activities, transport vehicles will be decontaminated at the load out area and inspected and manifested, as necessary.

3.3 VEHICLE DECONTAMINATION AND INSPECTION

Care will be taken to prevent the contamination of transport vehicles during load out for off-Site disposal. All vehicles exiting the Exclusion Zone will be decontaminated outside the Exclusion Zone. Dry decontamination procedures will be used for all vehicles that travel over contaminated materials prior to leaving the Site. Administrative, transport, and other vehicles not cross-trafficking over contaminated areas will not be decontaminated prior to exiting the Site. The dry decontamination process will consist of a scraping and brushing the tires with shovels and stiff-bristled brooms to remove any excess soils from the wheel wells, or tires.

Based on visual inspection, a wheel wash may be required to remove heavier accumulations of dirt or mud. A wheel wash station will be available for use as necessary to ensure contaminated material does not leave the Exclusion Zone. The water will be contained and pumped into temporary tanks and used on-Site for dust control in areas requiring remediation. All equipment used in decontamination will be routinely cleaned to prevent contaminating equipment.

Prior to leaving the Site, transport vehicles will be securely covered with a suitable tarpaulin. Tailgate locks will be inspected to ensure that they are secure and will prevent the release of waste/recyclable material from the vehicle during transportation.

All vehicles, especially trucks, leaving the site will drive over the tracking pads to remove any loose soils. Trucks requiring further attention will proceed to the designated decontamination pad for pressure washing of the tires. Wash water from the decon pad will be disposed of as contact water. It is anticipated that the aggregate construction exits will ensure the cleanliness of all vehicles leaving the site and wet decontamination methods will not be required.

3.4 TRANSPORTATION ROUTES AND SITE TRAFFIC CONTROL

Transport vehicle traffic will leave the Site on Glenn Ave. A flagman will be provided, if necessary, to allow transport vehicles to safely enter the flow of traffic. Escort vehicles may be deployed, if needed, to safely guide the transport vehicle through the Site. Transport vehicles will utilize city or state paved roads to transport waste materials to the appropriate off-Site disposal facility. The Site Traffic Control Plan will be implemented during transport.

3.5 OFF-SITE EMERGENCY SPILL RESPONSE

The transport route from the Site to the designated disposal facility will be inspected periodically by ENTACT personnel. Transport vehicle drivers will be advised to observe the designated route and immediately report any spills attributable to the transport of waste materials to the Project Manager.

In the event of an off-Site spill incident, the transporter will be responsible for ensuring that the appropriate cleanup is conducted. ENTACT will be responsible for the oversight and cleanup of all spills of transported material within Site boundaries. In general, spill clean-up procedures for transport vehicle spills that may occur during transport between the Site and the designated disposal facility will include the consolidation of spilled material and reloading of the material onto the transport vehicle. If waste material is spilled onto pavement, the impacted area will be swept visibly clean. If waste material is spilled onto a non-paved surface adjacent to the road, the loose material will be collected and the impacted area will be excavated, as appropriate, to ensure that spilled waste materials and potentially impacted soils are removed. Depending on the quantity of material spilled, hand tools and/or heavy equipment will be used to clean the spill area. If a spill occurs in a high traffic area, traffic cones, flares, signs, and flag persons will be mobilized, as necessary, to direct and control traffic.

3.6 TRANSPORTATION CONTRACTORS

ENTACT will load all excavated material into trucks for transportation and disposal at an approved, off-Site landfill.

3.7 DISPOSAL FACILITIES

Prior to the removal of any waste material from the Site, ENTACT will obtain the appropriate approvals from the landfill facility for the off-Site disposal of the designated waste streams. The written approval will include a list of the acceptance criteria the disposal facility will use in determining whether the loads will be accepted or rejected. ENTACT will finalize the selection of the disposal facility for each waste stream and provide the appropriate information before the material is transported off-Site. Soils shown to be nonhazardous by analytical testing will be transported to the RCRA Subtitle D landfill for disposal. Hazardous soils, upon approval and direction of the engineer, will be transported to the RCRA Subtitle C facility. Disposal facilities to be used for this removal action include:

RCRA Subtitle D landfill
BFI / Charlotte Motor Speedway Landfill
5105 Moorehead Road
Concord, NC 28027
704-782-2004

RCRA Subtitle C landfill
Chemical Waste Management
Highway 17 North, Mile Marker 163
Emelle, AL 35459
205-652-8156

3.8 DOCUMENTATION

The appropriate documentation will be generated and maintained for all material transported from the Site to an off-Site disposal/reclamation facility. A waste shipment record, waste manifest or bill of lading which identifies the generator, transporter and disposal facility and corresponding identification number, the nature of the material, the date and time the material was transported from the Site, and the estimated weight or volume of material will be provided with each loaded transport vehicle. The manifest or bill of lading will be signed by the EMES representative or designee, and the transport vehicle driver before the material is transported from the Site.

Upon receipt of the material, the disposal facility will be required to sign the manifest. A copy of the signed manifest will be returned to the EMES representative for record-keeping purposes.

Weight tickets will be obtained from the disposal/reclamation facility to verify the quantity of material transported from the Site for each workday. ENTACT will maintain a spreadsheet at the field office to track the quantities of generated waste materials requiring off-Site disposal or reclamation.

4.0 WORK PRODUCTS

4.1 DAILY, WEEKLY AND MONTHLY REPORTS

ENTACT will prepare and maintain daily work reports and other records to summarize all Site activities performed during completion of removal activities. At a minimum, the daily work reports will include a listing of personnel on-Site, equipment utilized, work performed, problems encountered (if any) and resolutions, and related information.

ENTACT will prepare status reports on a weekly basis to summarize activities performed at the Site during the previous week.

ENTACT will also prepare written monthly progress reports that:

- Describe the actions which have taken place during the month;
- Include a summary of all results of sampling and tests and all other data received or generated during the month;
- Identify all documents completed and submitted during the month;
- Describe all actions which are scheduled for the next six weeks, and information regarding construction progress;
- Include any Workplan modifications proposed/approved.

An authorized representative of ENTACT will sign all reports (other than the monthly progress report described above).

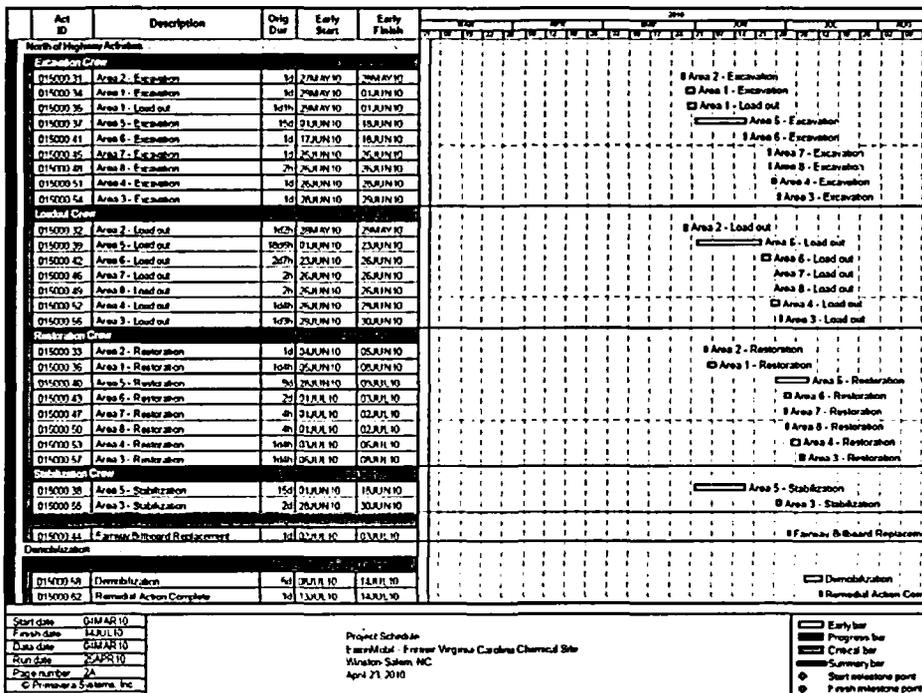

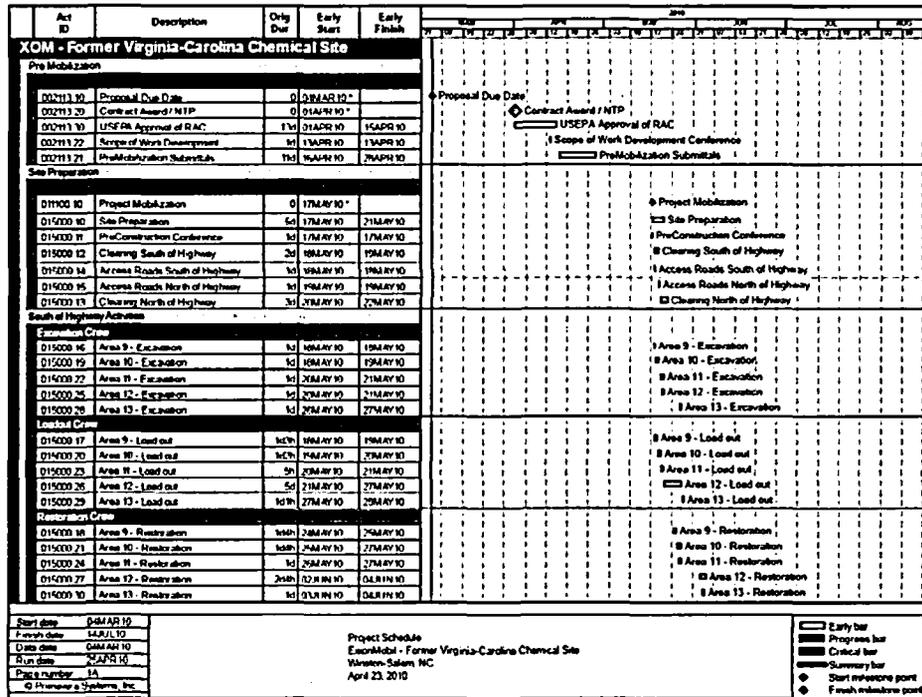

4.2 PHOTOGRAPHIC/DRAWING DOCUMENTATION

One set of the Site Drawings will be kept at the work area to accurately show any changes during implementation. Changes will be neatly and clearly marked. Drawings will be kept current with the progression of work performed. Upon completion of the contract, ENTACT will deliver one complete, accurate and legible set of Record Drawings to EMES's representative.

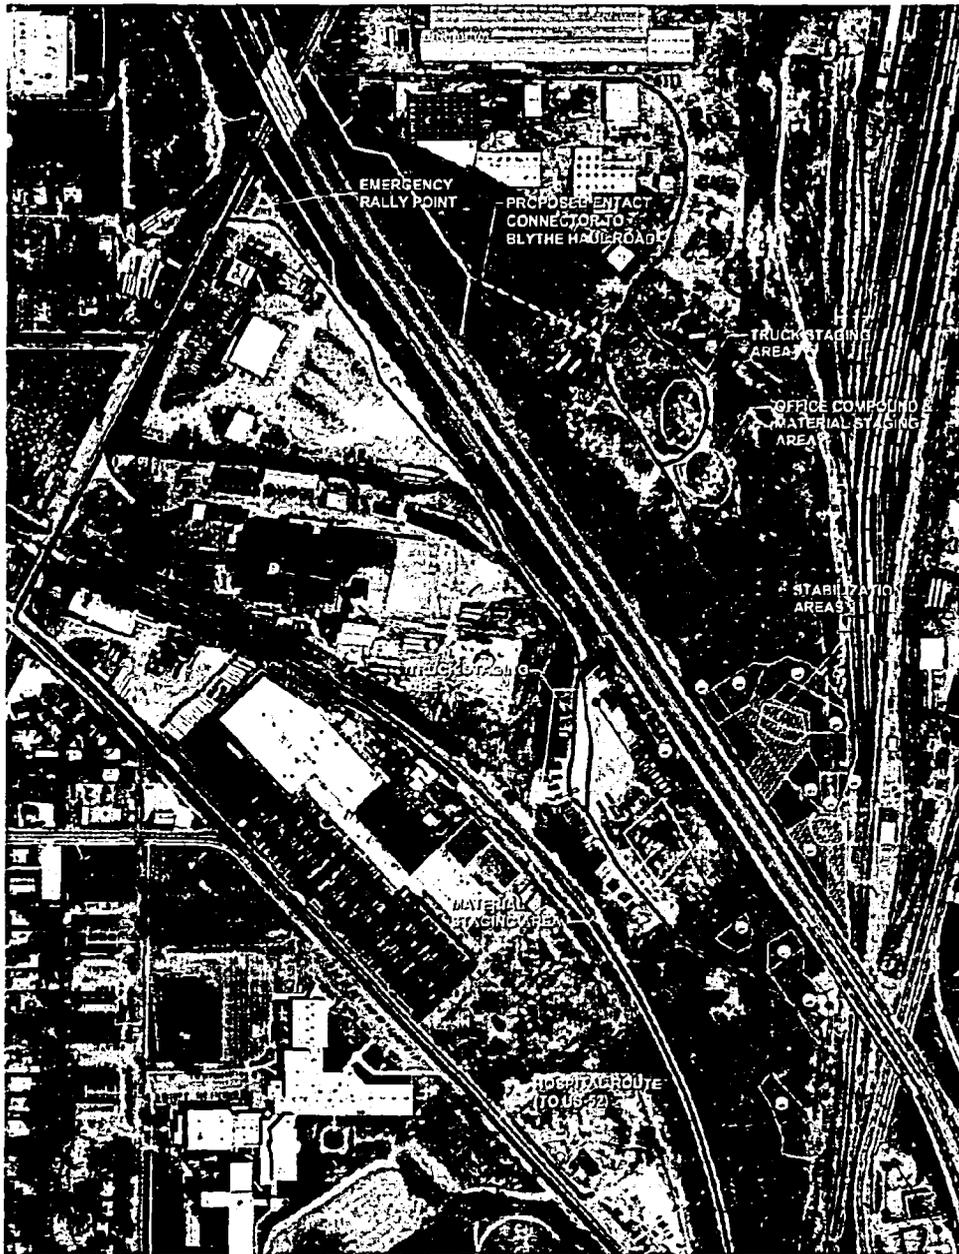

Photographs will be taken in order to serve as a pictorial record of work progress, problems, and mitigation activities. ENTACT's file at the Site will contain color photos, labeled with the date and subject of the photograph.

5.0 PROJECT SCHEDULE

A project schedule detailing the duration and sequence of the RA tasks is presented here.

Subject: Fw: CERCLA Off-Site Acceptability of Republic Charlotte Motor Speedway Landfill

Gentlemen - the purpose of this email is to approve the Republic Charlotte Motor Speedway Landfill for use during the Removal Action at the VCC Winston-Salem Site.

Below is some information that a co-worker in the RCRA program sent me regarding this issue.

Let me know if you have any questions regarding this issue.

Ken

The OSR acceptability status is dynamic in nature and subject to change, Region 4 has instituted a policy where EPA conducts a verification of continued acceptability (VCA) on facilities that have been previously found acceptable under the CERCLA Off-Site Rule (OSR) such as the Republic Charlotte Motor Speedway Landfill facility. The purpose of a VCA is to provide a periodic check to assure that the facility continues to be acceptable. VCAs are conducted when a request for OSR status is received and the previous VCA had been conducted more than 60 days prior. VCA are valid for 60 days.

A VCA was completed for the Republic Charlotte Motor Speedway Landfill facility on April 30, 2010, so the VCA is valid until June 30, 2010.

CERCLA waste shipments sent to the Republic Charlotte Motor Speedway Landfill facility up until June 30th, are in full compliance with the OSR. If CERCLA wastes are planned to be sent after this date, please contact me about a week or so prior to June 30th, so that a new VCA can be conducted at that time.

Subject: 4/30/10 Weekly Status Report: VCC Winston-Salem, NC

Ken/Tim - This email provides the required weekly report for the VCC-Winston-Salem, NC site. Please let me know if you have any questions or if you need any additional information.

Regards-
Matt Pelton

ACTIVITIES PERFORMED DURING PERIOD

1. Provided comments back to NCDOT on draft meeting minutes DOT prepared, waiting for further response from NCDOT.
2. Reviewed preliminary delineation data for Removal Area 9 and began preparing table and revised figure to summarize data.
3. Continued work on contract with Entact.
4. Continued work on pre-mobilization submittals.
5. Construction planning, procurement, and logistics.

ACTIVITIES TO BE PERFORMED DURING NEXT PERIOD

1. Circulate revised minutes from NCDOT meeting.
2. Provide data table and figure with Removal Area 9 update.
3. Continue work on contract with Entact.
4. Submit SOP and HASP.

ACTION ITEMS/OTHER

1. None.

END OF REPORT

Subject: Winston-Salem Mobilization

Ken/Tim – just wanted to provide you with an estimated mobilization schedule for Winston-Salem. This is contingent on completing some contractual items with Entact, but we are tentatively planning for the following:

- Initial mobilization on Wednesday May 12th to setup office trailer and begin delivery of equipment.
- Full mobilization on Monday May 17th to start site preparation activities and potentially soil removal later that week.
- We also plan to have a kickoff meeting on Monday the 17th in the afternoon. The meeting will be attended by Entact, ARCADIS, and Exxon personnel. EPA and NCDENR are invited to join as well.

I'll confirm schedule and times when we finalize these items, but wanted to give you some notice to block off the time if you'd like to attend. Thanks.

Matt

Subject: Winston-Salem VCC Borrow Source
Attachments: Transmittal 001 - 042610.pdf

Ken/Tim - Attached is an analytical laboratory report for a sample of backfill material obtained from the following source:

Vulcan Materials Company
4401 N. Patterson Ave
Winston-Salem, NC 27105

Please let me know if this borrow source will be acceptable for use at the Winston-Salem VCC site.

DATA QUALIFIERS AND DEFINITIONS

- B** Analyte was detected in the associated Method Blank.
- B1** Analyte was detected in the associated method blank. Analyte concentration in the sample is greater than 10x the concentration found in the method blank.
- M7** The MS and/or MSD were above the acceptance limits. See Blank Spike (LCS).
- M8** The MS and/or MSD were below the acceptance limits. See Blank Spike (LCS).
- MHA** Due to high levels of analyte in the sample, the MS/MSD calculation does not provide useful spike recovery information. See Blank Spike (LCS).
- MNR** No results were reported for the MS/MSD. The sample used for the MS/MSD required dilution due to the sample matrix. Because of this, the spike compounds were diluted below the detection limit.
- R3** The RPD exceeded the acceptance limit due to sample matrix effects.
- ND** Not detected at the reporting limit (or method detection limit if shown)

METHOD MODIFICATION NOTES

Cooler Received/Opened On 04/02/10 @ 08:00
0

NTD0219

1. Tracking # 2020 (last 4 digits, Fed. Ex.)

Courier: FED-EX IR Gun ID 97310166

2. Temperature of rep. sample or temp blank when opened 0.7 Degrees Celsius

3. If Item #2 temperature is 0°C or less, was the representative sample or temp blank frozen? YES NO NA

4. Were custody seals on outside of cooler?

YES NO NA

If yes, how many and where: (-FRONT)

5. Were the seals intact, signed, and dated correctly?

YES NO NA

6. Were custody papers inside cooler?

YES NO NA

I certify that I opened the cooler and answered questions 1-6 (initial) HA

7. Were custody seals on containers:

YES

NO

and Intact

YES NO NA

Were these signed and dated correctly?

YES NO NA

8. Packing mat'l used? Bubblewrap Plastic bag Peanuts Vermiculite Foam Insert Paper Other None

9. Cooling process:

Ice

Ice-pack

Ice (direct contact)

Dry ice

Other

None

10. Did all containers arrive in good condition (unbroken)?

YES NO NA

11. Were all container labels complete (#, date, signed, pres., etc)?

YES NO NA

12. Did all container labels and tags agree with custody papers?

YES NO NA

13a. Were VOA vials received?

YES NO NA

b. Was there any observable headspace present in any VOA vial?

YES NO NA

14. Was there a Trip Blank in this cooler? YES NO NA If multiple coolers, sequence # 1

I certify that I unloaded the cooler and answered questions 7-14 (initial) HA

15a. On pres'd bottles, did pH test strips suggest preservation reached the correct pH level? YES NO NA

b. Did the bottle labels indicate that the correct preservatives were used

YES NO NA

16. Was residual chlorine present?

YES NO NA

I certify that I checked for chlorine and pH as per SOP and answered questions 15-16 (initial) HA

17. Were custody papers properly filled out (ink, signed, etc)?

YES NO NA

18. Did you sign the custody papers in the appropriate place?

YES NO NA

19. Were correct containers used for the analysis requested?

YES NO NA

20. Was sufficient amount of sample sent in each container?

YES NO NA

I certify that I entered this project into LIMS and answered questions 17-20 (initial) HA

I certify that I attached a label with the unique LIMS number to each container (initial) HA

21. Were there Non-Conformance issues at login? YES NO Was a PIPE generated? YES NO # 1

Subject: 4/23/10 Weekly Status Report: VCC Winston-Salem, NC

Ken/Tim - This email provides the required weekly report for the VCC-Winston-Salem, NC site. Please let me know if you have any questions or if you need any additional information.

Regards-
Matt Pelton

ACTIVITIES PERFORMED DURING PERIOD

1. Held meeting with NCDOT on April 19th to discuss project coordination and logistics.
2. Performed delineation soil sampling activities around Removal Area 9.
3. Continued work on contract with Entact.
4. Continued work on pre-mobilization submittals.
5. Construction planning, procurement, and logistics.

ACTIVITIES TO BE PERFORMED DURING NEXT PERIOD

1. Circulate minutes from NCDOT meeting.
2. Continue work on contract with Entact.
3. Continue work on pre-mobilization submittals.

ACTION ITEMS/OTHER

1. None.

STATE OF NORTH CAROLINA
DEPARTMENT OF TRANSPORTATION

BEVERLY EAVES PERDUE
GOVERNOR

EUGENE A. CONTI, JR.
SECRETARY

April 23, 2010

*** REVISED ***

CONTRACT: C202129
WBS: 34871.3.2
F.A. NO.: BRNHS-52(19)
T.I.P. NO.: U-2826A
COUNTY: FORSYTH
LOCATION: BRIDGES #256 & #257 OVER NORFOLK SOUTHERN RAILROAD AND APPROACHES ON
US-52 IN WINSTON-SALEM

SUBJECT: Contaminated Soil Meeting

Dan Lenzen
Blythe Construction, Inc.
PO Box 31635
Charlotte, NC 28231-1635

Dear Mr. Lenzen:

A meeting to discuss the contaminated soil issues on the above project was held on Monday, April 19, 2010. Representing the Contractor were Messrs: Dan Lenzen, Raymond Foster, and Casey Jones of Blythe Construction along with Mr. John Sharpe of Cat-A-Hula Haulers, Mr. Mark Petschke of ENTACT Environmental Services, Mr. David Graham of Hart & Hickman, Messrs: Matthew Pelton & Matt Bowman (via phone) of ARCADIS. Representing the railroad was Mr. Stan Miller of Neel-Schaffer. Representing the Department of Environment & Natural Resources Superfund Section was Mr. David Mattison. Representing the Department of Transportation were Messrs: Wright Archer, Ross Pishdadi, Scott Wyrick, Tray Gaymon, David Trantham, David Lanier, Paul Gundlach and Cyrus Parker.

The following items were discussed:

- ◆ Wright Archer thanked everyone for attending and asked for an overview of what is being proposed in regards to the contaminated soil on this project.
- ◆ Matthew Pelton indicated that several areas of the project are contaminated with arsenic and lead due to the operations of previous occupants (fertilizer and ore plants). Most of the contaminated soil is outside of the project limits. However, there are identified contaminated areas ranging from 1' - 7' in depth within the work areas of this project. ARCADIS and ENTACT will remove these materials from the project and Norfolk Southern's right-of-way as identified on the Soil Removal Areas Plan provided by ARCADIS. Matthew also said that there are 3 monitoring wells, flush within the existing ground, within the work area. He requested that the contractor do his best to protect them. They are planning to coordinate soil removal work with Blythe Construction starting from the jack & bore area at -L- Sta. 50+00± on both sides and then they will move to the areas located on the left side of -L- between Sta. 41+00± to 45+00±. They will be monitoring the contaminants as they are removing them. At the bottom of each excavation area ARCADIS will take a soil sample for chemical analysis of the levels and existence of contaminants. The results of these tests samples will be back

Mr. Dan Lenzen
Contaminated Soil Meeting
April 23, 2010
Page 2

- within a few days. If the results are ok then Blythe can backfill the area within the project limits.
- ◆ Dan Lenzen asked how long before they can start the soil removal. Matthew replied that they have to submit their procedures to the EPA and it will take approximately 2 weeks for approval. Dan asked about the work schedule and approximate time to remove the contaminated soil on the southbound side of US-52. Mark Petschke replied that they will work Monday through Friday and it will take approximately 2 days per location.
 - ◆ Wright asked who will be responsible for maintaining the excavation area while we are waiting for the test results. Matthew said they will maintain the hole. There should not be any rain runoff into the hole except what falls into it and that will most likely percolate through.
 - ◆ Wright asked if they will have any problems if they jump around from the southbound side to the northbound side and back to the southbound side of the -L- line in order to remove the contaminated soil. Matthew said no.
 - ◆ Wright asked Blythe to submit a copy of the Hazard Communication Plan to DOT in regards to the contaminated soil. Dan said they have already submitted it but he will send in another copy.
 - ◆ Stan Miller asked if the contaminated soil within the railroad right-of-way will also be removed and if so, how close to the railroad tracks will they come. Matthew said yes, and they will not come any closer than 20' to any railroad tracks.
 - ◆ Raymond Foster expressed concern as to how ARCADIS will access the soil removal areas. Dan said they will be training their personnel and asked if he could have a copy of ARCADIS's Procedures and Hazard Communication Methods. Matthew said he will give Blythe a copy as soon as things have been approved by the EPA.
 - ◆ Wright asked about a contact person and Matthew said he will let everyone know soon.
 - ◆ Raymond asked if ENTACT will wear protective suits while working. Mark replied not at the current expected contaminant levels. They will continuously monitor the excavation and if levels change they may use the suits and/or other safety items as needed.
 - ◆ Wright asked if ARCADIS had an approved borrow source to use outside the DOT project limits. Matt said they will use an already approved borrow source.
 - ◆ A sample of the contaminated soils was passed around for information and education.
 - ◆ Wright asked if ARCADIS would locate the contaminated areas prior to the excavation because depending on the location and depth of cut, some areas adjacent to US-52 may require shoring. Matt said they will locate the areas. Dan and David Trantham asked to have a copy of the location coordinates. Dan said the Blythe Survey Party will mark the areas.
 - ◆ Cyrus Parker said there are some fuel tanks just outside of the right-of-way and they have leaked in the past so petroleum contaminated soil may be encountered when the Waste Management driveway is relocated. If anyone smells petroleum they need to stop and let Wright know.
 - ◆ Paul Gundlach asked for a copy of the Approved Methods and Hazard Communication Procedures from ARCADIS in order to train NCDOT personnel.

This concluded the meeting. These minutes are completed as noted. Any discrepancies to the content of the minutes should be provided in writing to the Resident Engineer. If no discrepancies are noted, this will indicate concurrence with the minutes as noted.

Sincerely,

W. R. Archer, III, PE
Resident Engineer

To: Archer, Wright R; Parker, Cyrus F
Subject: Minutes Comments

Wright – please see ARCADIS/Exxon comments on these meeting minutes below. Let me know what the best format is to convey this to the group, I can respond to the entire group on the original email if you think that is most appropriate.

Bullet #5 – While Entact expects to be able to work both sides of the road to facilitate the initial jack bore, jumping back and forth from both sides of the road will typically not be possible during the rest of the project. Following completion of work to facilitate the jack and bore Entact intends to complete all remaining work on the south/west side of the road prior to conducting further work on the north/east side of the road.

Bullet #8 – This point is not clear, based on our recollection Raymond's question related to physically accessing the north/east side of the road. Matthew informed him that Exxon had an access agreement in place with Atlantic Scrap to allow us access from N. Glenn Ave. We are not sure how this relates to the referenced training of Blythe personnel. Dan Lenzen with Blythe indicated that Blythe personnel would be kept out of soil removal areas until confirmation data documents them as being clean, so not clear what training of their personnel will be done. We will provide a copies of the ARCADIS and Entact HASPs, as well as Entact's Site Operations Plan to Blythe for their review and understanding after submittal has been made to EPA, however, Blythe personnel should remain out of soil removal areas until all soil removal has been completed.

Bullet #11 – While Entact currently expects to use the permitted Vulcan borrow source, analytical data on this source will need to be approved by USEPA and NCDER prior to use for fill on this project, this has not yet occurred.

Bullet #12 – the material passed around by David Graham of Hart & Hickman was a slag material, not soil. This material is evident on the ground surface near the existing ruins, and may be related to the former Carolina Ore Company processes that operated adjacent to the VCC site. Carolina Ore formerly operated a nodulating plant and rotary kiln at this location that processed waste materials and cinders from various industrial processes into iron ore briquettes and nodules. This slag material is not necessarily related to VCC operations and may not be indicative of arsenic or lead impacts in the soil. The nearest ARCADIS soil borings to this area, MW-2 and SB-56, had arsenic and lead concentrations below the site action levels. The removal actions to be performed by ARCADIS/Entact are based on soils containing arsenic and lead above the agency-approved action levels.

RE: State Concurrence with the Request for a Time-Critical Removal Action
Former Virginia-Carolina Chemical Company Winston-Salem Site
Winston-Salem, Forsyth County, North Carolina

Dear Mr. Mallary:

The State of North Carolina has reviewed the attached *Request for a Time-Critical Removal Action* at the Former Virginia-Carolina Chemical Company Winston-Salem Site ("Site"). The State of North Carolina concurs with the *Request for a Time-Critical Removal Action*, subject to the following conditions:

1. State concurrence on the *Request for a Time-Critical Removal Action* ("Request") and the selected remedy for the Site is based solely on the information contained in the subject Request. Should the State receive new or additional information that significantly affects the conclusions or remedy selection contained in the Request, it may modify or withdraw this concurrence with written notice to the United States Environmental Protection Agency (US EPA) Region IV.
2. State concurrence on this Request in no way binds the State to concur in future decisions or commits the State to participate, financially or otherwise, in the cleanup of the Site. The State reserves the right to review, overview, comment, and make independent assessment of all future work relating to this Site.

3. If, after remediation is complete, the total residual risk level exceeds 10^{-6} , the State may require deed recordation/restriction to document the presence of residual contamination and possibly limit future use of the property as specified in NCGS 130A-310.8.

The State of North Carolina appreciates the opportunity to comment on the *Request for a Time-Critical Removal Action* for the subject Site and looks forward to working with the US EPA on the final remedy. If you have any questions or comments, please feel free to contact David Mattison at (919) 508-8466 or at david.mattison@ncdenr.gov.

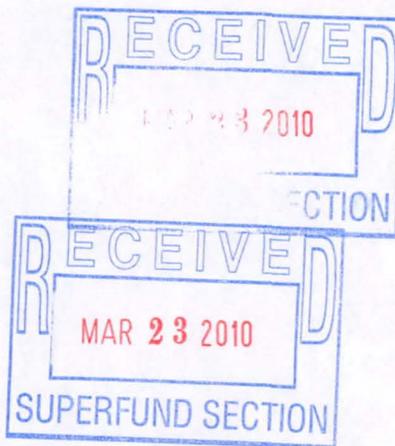

Sincerely,

Jack Butler, Chief

COMMENTS

ARCADIS G&M of North Carolina, Inc.
NC Engineering License # C-1869
NC Surveying License # C-1869

1. **impacted soils should be removed to approximately 1 to 2 feet below impacted areas.**

Response:

The SSALs for arsenic and lead at this site are 22 milligrams per kilogram (mg/kg) and 270 mg/kg, respectively, as described in the SDR/RAWP. As stated in Section 5.3.7 of the SDR/RAWP, field screening will be conducted with an x-ray fluorescence (XRF) instrument at the base of soil excavation. If the XRF screening results indicate that arsenic and/or lead concentrations are greater than the Site-Specific Action Levels (SSALs) specified in the SDR/RAWP, additional rounds of soil removal and XRF screening will be

conducted, as appropriate, to verify that sufficient soil has been removed from the excavation. Confirmation samples will also be collected from individual sub areas excavated to the same depth at a frequency of one sample (5-point composite) per 5,000 square feet of excavation. If analyses indicate arsenic and lead concentrations are below the SSALs, the excavation area will be backfilled and restored as described in Section 5.3.10 of the SDR/RAWP. However, if arsenic or lead are detected at concentrations above the SSALs, additional rounds of vertical soil removal and confirmation sampling will be conducted as appropriate.

- 2. Post excavation confirmation samples should be analyzed for specific PAHs and/or metals detected during the site assessment phase.**

Response:

Site characterization at other former VCC Sites in USEPA Region 4 established that site-related constituents of concern (COCs) are arsenic and lead. At this Site, arsenic and lead are the COCs that EMES has responsibility for; therefore, the EMES soil removal action will only address these metals. Additional samples for expanded analysis for waste characterization have been collected as required by the disposal facility, and those data are presented in the SDR/RAWP.

EMES will coordinate with NCDOT should NCDOT wish to have their contractor collect samples for additional analysis, however, EMES will not be responsible for costs associated with those analyses, or with additional remedial activities that may be deemed necessary based on COCs other than arsenic or lead.

- 3. Expand excavation Area 9 and Area 11 to address Environmental Investigation's Boring P8GP3 and Hart and Hickman's boring 8-3, respectively.**

Response:

As stated in Section 1.3.1 of the SDR/RAWP, the exact locations of soil borings collected during the 2005 Environmental Investigation (EI) activities are unknown because the boring locations were not surveyed and the map that provided the locations was not of a high enough quality to determine the exact sample locations; therefore, results of the EI sampling activities were not used to establish the soil removal areas at the site. While the exact location of soil sample P8GP3 is unknown, it is known to have been collected at a depth of 8 feet below ground surface and to have contained lead at a low concentration of 342 mg/kg, below the NCDENR PSRG for lead of 400 mg/kg. The lead concentration is slightly above the NCDENR Protection of Groundwater SRG for lead of 270 mg/kg, however, due the unknown location and depth EMES believes any future evaluation of

groundwater impacts at the site will adequately address this location. EI samples collected at shallower depths with arsenic or lead above SSALs all appear to be within proposed removal areas based on available mapping.

Soil boring location 8-3 was mistakenly omitted from adjacent Removal Area 11. Figure 4-1A has been revised to include this sample location within the removal area. Table 5-1 and appropriate sections of the text have also been revised to reflect the correct surface area based on this revision. These changes were included in the revised SDR/RAWP submitted to USEPA and NCDENR, and copied to NCDOT, on February 5, 2010.

4. **Post excavation sampling should be performed at a higher frequency than proposed.**

Response:

Consistent with a similar comment from NCDENR, the confirmation sampling frequency has been doubled and confirmation samples will now be collected as 5-point composites at a frequency not to exceed one 5-point composite per 5,000 square feet of excavation. Each removal area will have a minimum of one 5-point composite sample. In addition to the composite samples being submitted to the analytical laboratory for analysis of arsenic and lead, each individual composite aliquot will be screened in the field using an XRF to ensure it is below the SSALs. Table 5-2 (Summary of Confirmation Sampling Program) has been added to the revised SDR/RAWP to present the estimated number of confirmation soil samples to be collected from each removal area. Section 5.3.7 has been revised to refer the reader to Table 5-2.

RE: Request for Identification of State ARARs
Former Virginia-Carolina Chemical Company Winston-Salem Site
Winton-Salem, Forsyth County, North Carolina

Dear Mr. Mallary:

The North Carolina Department of Environment and Natural Resources (NC DENR) Superfund Section has received the *Request for Identification of State ARARs* for the Former Virginia-Carolina Chemical Company Winston-Salem Site located in Winton-Salem, Forsyth County, North Carolina. The following attached North Carolina Applicable or Relevant and Appropriate Requirements (ARARs) are to be met at this Site.

The NC DENR Superfund Section appreciates the opportunity to respond to this request. If you have any questions or comments, please feel free to contact me at (919) 508-8466 or at david.mattison@ncdenr.gov.

Sincerely,

David B. Mattison

Cc: Mattison, David
Subject: EPA/DENR Responses to NC DOT's comments on VCC Winston-Salem Removal Design

Matt, Steven - I talked with David Mattison yesterday about NCDOT's comments on the VCC Winston-Salem Removal Design. Below are responses to NCDOT's comments.

Comment regarding the removal of 1 to 2 feet of soil beneath each excavation

David and I agree that excavating and removing an additional 1 to 2 feet of soil beneath each excavation is not warranted. David and I agree the combination of visual inspection, XRF screening, and soil verification sampling that will be performed during the Removal Action is adequate to ensure that lead and arsenic contamination is not left in the bottoms of the excavations at levels above the EPA and State Removal Action levels established for the Site.

Comment regarding analyzing post-excavation confirmation samples for the specific PAHs and/or metals detected during the site assessment phase

David and I agree the post-excavation confirmation sampling for lead and arsenic is warranted, and post-excavation confirmation sampling for PAHs and other metals is not warranted, during the Removal Action at the Site, for the following reasons. Lead and arsenic contamination in soil is well-documented as being related with former phosphate fertilizer facilities that used the lead acid chamber process. Post-excavation confirmation sampling for lead and arsenic is consistent with the confirmation sampling approach used at other removal actions in Region 4 to address former phosphate fertilizer sites, as lead and arsenic are consistently the main "risk-drivers" for these sites. David and I agree that constituents such as PAHs are not commonly associated with former phosphate fertilizer manufacturing. David and I also agree that the presence of PAHs in Site soils may be due to the fact that other potential sources of PAHs exist on the properties surrounding the Site.

Comment regarding expanding excavation area 9 and Area 11 to address boring location P8GP3 and Hart and Hickman boring 8-3

David and I do not agree with NCDOT's comment regarding expanding the excavation area to include boring location P8GP3. This is based on the fact that the historical data indicates the contamination at P8GP3 is an isolated occurrence at a depth of 8 feet below land surface, which is not considered to be a direct contact risk to humans or a significant threat to groundwater quality. David and I agree with NCDOT's comment that Hart and Hickman boring location 8-3 should be included in the area to be addressed during the Removal Action.

Comment recommending the post-excavation confirmation sampling should be performed at a higher frequency than proposed

David and I agree with NCDOT's comment. Increasing the frequency of post-excavation confirmation sampling should increase the level of confidence that the soil in the bottoms of the excavations does not exceed the EPA and State removal action levels established for the Site.

Matt - the purpose of this email is to approve the RAWP for the VCC Winston-Salem Site.

Let me know if you would like for me to send you a separate approval letter.

For my clarification, does the revised RAWP that you sent me include the final drawings and figures?

FYI - I will be working with Tonya James to place a copy of the Final RAWP in the information repository in Winston-Salem along with the signed Action Memo and AOC once it is signed (which hopefully will be in the next week or so). Once these documents are in place, EPA will publish a notice informing the local community about the upcoming Removal Action and to announce the 30-day comment period that is required.

While holding a public availability session is not a requirement for a Time Critical Removal Action, EPA, NCDENR, and ExxonMobil can decide whether or not to have a public availability session based on the amount of public feedback we get.

Subject: Winston RAWP

Hello Ken, just wanted to check in with you and give you an update on Winston. Our bids are all in we're in the process of reviewing them. Hopefully Exxon will be able to select a contractor within the next week or so, we'll keep you posted.

Also wanted to check on status of the RAWP. We'd like to send copies out to the property owners, but would prefer to have approval on the document before we do that. Please let me know if you have any further questions, thanks.

ENFORCEMENT ACTION MEMORANDUM

Subject: Request for a Time-Critical Removal Action at the Virginia Carolina Chemical Company Site, Winston-Salem, Forsyth County, North Carolina

From: Tim Neal, On-Scene Coordinator *① 2/17/10*
Emergency Response and Removal Branch

McKenzie Mallary, Remedial Project Manager *McKML - 2/17/2010*
Superfund Remedial and Site Evaluation Branch

Thru: Shane Hitchcock, Chief *[Signature]*
Emergency Response and Removal Branch *SH*

To: Franklin E. Hill, Director *[Signature]*
Superfund Division

I. Purpose

The purpose of this Action Memorandum, pursuant to Section 104 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), is to request and document approval of the proposed enforcement-lead Time-Critical Removal Action described herein for the Virginia-Carolina Chemical Company (VCC) Site ("the Site"), located in Winston-Salem, Forsyth County, North Carolina.

The Site poses a potential threat to public health and the environment that meets the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) Section 300-415(b) (2) criteria for a Time-Critical Removal Action. ExxonMobil Oil Corporation is the corporate successor to VCC. This Removal Action will be enforcement-lead pursuant to an Administrative Order on Consent (AOC) with ExxonMobil Corporation.

II. SITE CONDITIONS AND BACKGROUND

A. Site Description

Site ID#: A4YD

Type: Time Critical Removal Action

The Site is the location of a former phosphate fertilizer plant in Winston-Salem, North Carolina. The plant was constructed by Southern Chemical Company between 1895 and 1900, and was continuously operated through 1927.

Phosphate fertilizer manufacturing at the Site generally involved reacting phosphate ores with sulfuric acid to produce phosphoric acid, the building block of Nitrogen-Phosphorus-Potassium (N-P-K) agricultural fertilizers. Sulfuric acid was made at the Site and stored in lead-lined chambers. Environmental impacts typically associated with phosphate-based fertilizer manufacturing facilities include acidic pH conditions and elevated concentrations of metals, including lead and arsenic in soil, groundwater, sediment, and surface water.

A review of the available Sanborn Fire Insurance maps confirmed that the former VCC Winston-Salem plant was a complete factory with acid production facilities throughout its entire operational history. At various times throughout the plant's history, its features included an acid chamber structure, compressor room, pyrite burners, a pyrite house, acid towers, a nitre house, a boiler room, a pump house, various water towers, a 100,000-gallon reservoir, a tobacco stem and grinding warehouse and associated drying furnace, a transformer house, rock sheds, a mill building (for grinding, mixing, storage, and bagging of fertilizer), a bag house, a motor printing press, several storage warehouses, scales, a corn crib, and an office.

VCC acquired the plant from Southern Chemical Company in 1902, merged into Socony Mobil Oil Company, Inc., in 1963, and the company name changed to Mobil Oil Corp. in 1966. In 1999, Exxon Corporation merged with Mobil Corporation to form Exxon Mobil Corporation. Mobil Oil became ExxonMobil Oil Corporation, the corporate successor to VCC, and subsidiary to Exxon Mobil Corporation.

1. Removal Site Evaluation

Several investigations have been conducted at the Site. In 2005, the North Carolina Department of Environment and Natural Resources (NCDENR) and Environmental Investigations, Inc. (EI), on behalf of the North Carolina Department of Transportation (NCDOT), collected soil samples from 29 locations from the ground surface to a maximum depth of 20 feet below the ground surface. Arsenic and lead were detected in soil samples at concentrations exceeding the EPA Region 4 Removal Action Levels (RALs) of 40 ppm and 400 ppm, respectively.

In November 2008, ARCADIS, on behalf of ExxonMobil Environmental Services (EMES), and in coordination with NCDOT, collected soil samples from the Site as described in the *VCC Winston-Salem Site: Soil Screening and Sampling Event Summary Report* (ARCADIS, 2009). A total of 38 soil samples were collected and analyzed to determine the extent of arsenic and lead concentrations in the soil that potentially lie within or adjacent to the Site boundaries and beneath US Hwy 52/SR-8. Arsenic and lead were detected in soil at concentrations exceeding the EPA Region 4 RALs. Arsenic was detected in one sample collected from a depth of 38.5 to 40 feet below the surface beneath US Hwy 52/SR-8 at a concentration of 121 mg/kg. Lead was detected in one soil sample collected from a depth of 3 to 5 feet beneath US Hwy 52/SR-8 at a concentration of 278 mg/kg.

In March 2009, Hart & Hickman (H&H), on behalf of NCDOT, collected a total of 35 soil samples within the proposed NCDOT right-of-way along US Hwy 52/SR-8. Arsenic and lead were detected in soil at concentrations exceeding the EPA Region 4 RALs.

In May 2009, ARCADIS, on behalf of EMES, conducted a Removal Site Evaluation (RSE) at the Site. A total of 71 soil samples were collected and analyzed from 24 soil boring locations during the RSE. Arsenic and lead were detected in soil at concentrations exceeding EPA Region 4 RALs. The majority of the elevated arsenic and lead concentrations in soil was detected in the northeastern and eastern portions of the Site. The maximum arsenic and lead concentrations detected in soil samples collected north of Hwy 52/SR-8 were 364 mg/kg and 20,100 mg/kg, respectively. The maximum arsenic and lead concentrations detected in soil samples collected south of Hwy 52/SR-8 were 238 mg/kg and 4,380 mg/kg, respectively.

Based on the analytical results from the May 2009 investigation, additional delineation activities were conducted by ARCADIS, on behalf of EMES, in October and November 2009. These activities included the collection of an additional 142 soil samples from 48 soil boring locations, the installation of five groundwater monitoring wells, and the collection of groundwater samples from four of the wells. Toxicity Characteristic Leaching Procedure (TCLP) arsenic and lead analyses were also performed on 23 soil samples collected and composited from 25 soil boring locations where arsenic and/or lead concentrations exceeded the EPA Region 4 RALs. In addition, two of the composite waste characterization samples were analyzed for TCLP metals, TCLP volatile organic compounds (VOCs), TCLP benzene, toluene, ethylbenzene, and xylene (BTEX), TCLP semi-volatile organic compounds (SVOCs), and polychlorinated biphenyls (PCBs). These analyses were performed to provide data to determine appropriate soil disposal requirements when evaluating potential soil removal response actions.

2. Physical Location

The Site is located in Winston-Salem, Forsyth County, North Carolina (Figure 1-1). The Site is in an old industrial area located northeast of downtown Winston-Salem.

The Site is bounded to the north by Norfolk Southern's rail yard and the Atlantic Scrap facility, to the east by the Norfolk Southern Railroad (and north Liberty Street beyond), to the south by vacant industrial land (and Indiana Avenue beyond), to the southwest by the Norfolk Southern railroad (and NCDOT Site No. 54 beyond), and to the west by a rolling storage yard owned by Waste Management of the Carolinas, Inc. The Site is bisected from northwest to southeast by US Hwy 52/SR-8. The approximate geographical center of the Site is 36.1270° North Latitude and 80.2342° West Longitude.

Currently, the Site is occupied by two tax parcel maps. Current property boundary information was obtained from the 2007 Forsyth County tax map.

3. Site Characteristics

The Site lies within the upstate region of North Carolina along the US Hwy 52/SR-8 corridor. The Site lies within the Piedmont Physiographic Province of North Carolina, which is characterized by generally rolling and well-rounded hills and ridges. Elevations at the Site vary from approximately 937 to 970 feet above mean sea level. The Site is underlain by gneiss and schist of the Charlotte Belt, which consists of fine-grained biotite-quartz-feldspar gneiss and some inter-layered augen gneiss. Amphibolite layers occur locally and intrusive dikes of pegmatite and granite are also present.

The majority of the Site is heavily-vegetated. Portions of the Site that are not vegetated are covered by asphalt and gravel roads, parking areas, and railroad corridors. Surface water runoff generally flows to the northeast towards the Bowen Branch of Brushy Fork Creek located approximately 700 feet north of the Site. Bowen Branch flows easterly and discharges to Brushy Fork, and in turn, Brushy Fork discharges to Salem Creek on the east site of Winston-Salem. Salem Creek flows westerly through downtown Winston-Salem and discharges to the Yadkin River. On a regional scale, the Site is located within the Yadkin-Pee Dee River Basin.

4. Release or Threatened Release into the Environment of a Hazardous Substance, or Pollutant or Contaminant

The RSE, conducted in May 2009, and subsequent delineation activities conducted in October and November 2009, are the most recent sampling investigations conducted at the Site. The following is a brief bullet summary of the RSE:

- A total of 213 soil samples were collected and analyzed from 72 soil boring locations;
- Arsenic was detected in 14 soil samples at concentrations exceeding the EPA Region 4 RAL of 40 mg/kg;
- Lead was detected in 15 soil samples at concentrations exceeding the EPA Region 4 RAL of 400 mg/kg;

- The maximum arsenic and lead concentrations detected in soil samples collected north of US Hwy 52/SR-8 were 364 mg/kg and 20,100 mg/kg, respectively;
- The maximum arsenic and lead concentrations detected in soil samples collected south of US Hwy 52/SR-8 were 238 mg/kg and 4,380 mg/kg, respectively;
- Twenty-one soil samples were analyzed for TCLP arsenic and lead; none of the samples contained detectable concentrations of arsenic; six (6) samples contained TCLP lead at concentrations above the standard of 5.0 mg/L;
- Groundwater samples were collected from 4 groundwater monitoring wells; arsenic was not detected in any of the groundwater samples; lead was detected in one well at a concentration exceeding the North Carolina 2L Drinking Water Standard; and
- The Time-Critical Removal Action will address the Site-related contamination prior to the NCDOT's highway expansion project along US 52/SR-8, scheduled for summer 2010.

5. National Priorities List (NPL) Status

As part of the Phosphate Fertilizer Initiative, ExxonMobil is voluntarily working with EPA and the State to address the soil contamination at the Site. This Site is not on the NPL, but EPA considers this Site to be NPL-equivalent. A ranking package could be prepared in the future, and the Site could be proposed to the NPL, if needed.

6. Maps, Pictures, and Graphic Representations

Figures 1-1, 4-1A, and 4-1B from the SDR/RAWP are attached to this Action Memorandum as Attachments 1, 2, and 3. Attachment 4 is the State's ARARs letter and ARARs tables, and Attachment 5 is the RAWP. Figure 1-1 is a Site location map, while 4-1A and 4-1B show the areas to be addressed during the Removal Action.

B. Other Actions To Date

1. Previous Actions

There have been no known actions taken at the Site to investigate the presence of Site-related contamination, or mitigate conditions, other than the investigations described in section II (A) (1) of this document.

2. Current Actions

Before the Removal Action begins at the Site, EPA and ExxonMobil will finalize an Administrative Settlement Agreement and Order on Consent for Removal Action (AOC) which will provide for implementation of the Removal Action at the Site, as well as continued investigations of the Site (if needed).

C. State and Local Authorities' Role

1. State and local Actions to Date

EPA and NCDENR have provided oversight during the Site Delineation and Removal Site Evaluation, and will continue to work together to coordinate oversight responsibilities during the Removal Action.

EPA will communicate with local officials throughout the Removal Action. The local officials have been notified about the 30-day comment period to be held prior to and/or during the Removal Action.

III. THREATS TO PUBLIC HEALTH OR WELFARE OR THE ENVIRONMENT AND STATUTORY AND REGULATORY AUTHORITIES

According to the criteria listed in Section 300.415 of the National Contingency Plan (NCP), the Site meets the requirements for initiating a Time-Critical Removal Action. Specifically, these include the following determinations:

A. Threats to Public Health or Welfare

Section 300.415(b)(2)(iv) - "*soil with high levels of hazardous substances or pollutants or contaminants in soils largely at or near the surface, that may migrate*". EPA has determined the following conditions exist at the Site which meet the requirements for initiating a Time-Critical Removal Action. Arsenic levels as high as 364 mg/kg or parts-per-million (ppm) exist in surface and/or subsurface soil; lead levels as high as 20,100 ppm exist in surface and/or subsurface soil. These levels of arsenic and lead in soil exceed EPA Region 4's RALs of 40 ppm and 400 ppm, respectively, for the protection of human health through direct contact exposure.

IV. ENDANGERMENT DETERMINATION

Actual or threatened releases of hazardous substances from this Site, if not addressed by implementing the response action selected in this Action Memorandum, may present an imminent and substantial endangerment to public health, or welfare, or the environment.

V. PROPOSED ACTIONS AND ESTIMATED COSTS

A. Proposed Actions

Due to the inherent uncertainties associated with the removal options evaluated for use at the Site, the On-Scene Coordinator, and EPA's designated Project Manager, in a manner consistent with the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), remain obligated to modify removal procedures as conditions warrant.

1. Description of Proposed Response Actions

An estimated 18,504 cubic yards of Site-related soil contamination and debris (e.g., concrete, brick, railroad ties, etc.) exceeding the EPA Region 4 RALs will be excavated. Construction debris over one cubic yard in size will be left in place, or will be cleaned and left on-Site. Actual excavation limits will be determined in the field based on the confirmation sampling program. The soil removal areas encompass a total area of approximately 3.7 acres, and range in depth from 1 to 7 feet below land surface. ExxonMobil will treat and/or dispose of the contaminated soils and debris according to appropriate industry and regulatory standards.

Soils with TCLP arsenic and/or lead concentrations greater than or equal to 5.0 mg/l will either be stabilized and transported to a RCRA Subtitle D landfill for disposal, or transported to a RCRA Subtitle C landfill without being stabilized. Stabilization will be achieved via mixing of a phosphate-based stabilization agent with the soil in batches of approximately 200 tons so that efficient and uniform blending can be achieved.

Institutional Controls (i.e., a restrictive covenant) will be applied to the Site property to ensure the long-term protection of human health and the environment at the Site, as well as to ensure the integrity of the Time-Critical Removal Action is not jeopardized by future construction and/or redevelopment activities at the Site.

ExxonMobil will restore areas which are disturbed by the Removal Action to their pre-removal state to the maximum extent practicable. Areas that overlap with the NCDOT's highway expansion project along highway 52/SR-8, scheduled for summer 2010, will be restored consistent with NCDOT's project objectives. The need for additional groundwater monitoring at the Site will be determined once the Soil Removal Action is complete.

The preferred response action to address soil contamination is selected for use at the Site for the following reasons:

- A. The preferred response action is considered technically feasible because it has been successfully implemented at other sites, and the materials and qualified commercial contractors are readily available;

- B. The preferred response action offers a balance between effectiveness and cost, (i.e., it is a cost-effective method of providing protection of human health and the environment; and
- C. EPA and NCDENR concur on the use of the preferred response action to address soil contamination at the Site.

2. Contribution to Remedial Performance

The proposed Time-Critical Removal Action will address the potential threats discussed in Section III, which meet the removal criteria established in Section 300.415(b)(2) of the NCP. Although future action under the EPA's Remedial program is unlikely, the Removal Action contemplated in this Action Memorandum is considered to be consistent with any future Remedial Action.

3. Engineering Evaluation/Cost Analysis (EE/CA)

This proposed action is a Time-Critical Removal Action and does not require an EE/CA.

4. Pre-Design Investigations/Removal Site Evaluation

Pre-Design investigations, including the Removal Site Evaluation (RSE) were conducted at the Site. The Final SDR/RAWP report, dated February 2010, is attached to this Action Memorandum – see Attachment 5.

5. Applicable or Relevant and Appropriate Requirements (ARARS)

On-site removal activities conducted under CERCLA are required to attain ARARs to the extent practical considering the exigencies of the situation. Off-site removal activities need only comply with all applicable Federal and State laws, unless there is an emergency. EPA requested and received a list of state ARARs from NCDENR – see Attachment 4. All waste transferred off-site will follow the CERCLA Off-site Rule.

6. Project Schedule

The design document for the Time-Critical Removal Action, referred to the SDR/RAWP, has been finalized. The Time-Critical Removal Action is scheduled to begin at the Site in March 2010.

VI EXPECTED CHANGE IN THE SITUATION SHOULD ACTION BE DELAYED OR NOT TAKEN

If the Removal Action is significantly delayed or not taken at the Site, the potential threats explained in Section III of this Action Memorandum will continue to exist.

VII. OUTSTANDING POLICY ISSUES

EPA has chosen to address the contamination at the Site using EPA's Removal authority. EPA has extensive experience using Removal authority to investigate and implement removal actions to address contamination at former phosphate fertilizer plant sites located in Region 4. Contamination at the Site consists of lead and arsenic in the surface and subsurface soil, sediment, and groundwater, and conventional removal techniques will be utilized during the NTCRA to address the contamination.

Slightly-acidic pH conditions in the groundwater at the Site may have resulted in the mobilization of metals where they are present in the subsurface soil; however, only one groundwater monitoring well at the Site has contained a lead concentration above the North Carolina 2L drinking water standard. None of the groundwater samples have contained arsenic at concentrations above the North Carolina 2L drinking water standard.

ICs will be required for the Site in the form of a restrictive covenant. ExxonMobil will be responsible for placing the restrictive covenant on the property deed for the Site. The ICs will help to ensure the integrity of the Time-Critical Removal Action is not compromised, thereby ensuring the long-term protection of human health and the environment. The ICs will remain on the property deed until such time that EPA and/or NCDENR determine the ICs are not needed to protect human health and the environment.

VIII. ENFORCEMENT

As the corporate successor to the Virginia-Carolina Chemical Company (VCC), ExxonMobil Oil Corporation has been identified as the potentially responsible party (PRP) for the Site. EPA and ExxonMobil, parent to the ExxonMobil Oil Corporation, are currently negotiating the terms of the AOC for conducting the Removal Action. EPA expects ExxonMobil will sign the AOC, thereby agreeing to fund and conduct the Time-Critical Removal Action.

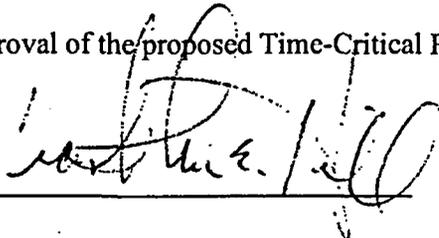

IX. RECOMMENDATIONS

This decision document sets forth the selected Time-Critical Removal Action for the Virginia-Carolina Chemical Company (VCC) Winston-Salem Site ("the Site"), located in Winston-Salem, Forsyth County, North Carolina. This Action Memorandum has been developed in accordance with CERCLA, as amended, and is consistent with the

NCP. The selection of the preferred response actions is based on the Administrative Record for the Site.

Conditions at the Site meet the NCP section 300.415 (b) (2) criteria for a Time-Critical Removal Action. In addition, the Time-Critical Removal Action will address the Site-related contamination prior to the NCDOT's highway expansion project along US 52/SR-8, scheduled for summer 2010.

I recommend your approval of the proposed Time-Critical Removal Action.

(Approval)  Date: 2/15/2010

RE: Request for Identification of State ARARs
Former Virginia-Carolina Chemical Company Winston-Salem Site
Winton-Salem, Forsyth County, North Carolina

Dear Mr. Mallary:

The North Carolina Department of Environment and Natural Resources (NC DENR) Superfund Section has received the *Request for Identification of State ARARs* for the Former Virginia-Carolina Chemical Company Winston-Salem Site located in Winton-Salem, Forsyth County, North Carolina. The following attached North Carolina Applicable or Relevant and Appropriate Requirements (ARARs) are to be met at this Site.

The NC DENR Superfund Section appreciates the opportunity to respond to this request. If you have any questions or comments, please feel free to contact me at (919) 508-8466 or at david.mattison@ncdenr.gov.

Sincerely,

David B. Mattison
Environmental Engineer
NC DENR Superfund Section

Subject:

Response to USEPA and NCDENR Comments
Site Delineation Report/Remedial Action Work Plan
Former Virginia-Carolina Chemical Company Winston-Salem Site
Winston-Salem, Forsyth County, North Carolina

Dear Mr. Mallary:

This letter provides responses to comments received from the United States Environmental Protection Agency (USEPA) (received January 26, 2010) and North Carolina Department of Environment and Natural Resources (NCDENR) (received January 22, 2010) on the *Site Delineation Work Plan, Former Virginia-Carolina Chemical Company Winston-Salem Site, Winston-Salem, Forsyth County, North Carolina (Work Plan)* dated January 2010. USEPA and NCDENR comments are provided in bold typeface followed by the response in standard typeface. Revision No. 1 of the Work Plan is enclosed.

RESPONSE TO USEPA COMMENTS

1. **General Comments** – The sample designations in the text of the **SDR/RAWP** do not match the sample designations on the Figures. Please add language to the document, and in the legend of each figure, that explains the discrepancy in the sample designation.

Response:

As shown in the Work Plan text and tables, all ARCADIS sample designations begin with the prefix "WS-". Soil boring sample designations (with the exception of WS-EB2-D and WS-B1-C) are identified as "WS-SB-XX", where XX is the soil boring number. Monitoring well sample designations are identified as "WS-MW-XX", where XX is the monitoring well number. Figures 2-1, 2-2, 3-1, 3-2, 4-1A, and 4-1B have been revised to reflect this change. To minimize print on the figures the "WS-" has been omitted on the figures.

2. **Page 6, Section 1.3.2** – In the second paragraph, third sentence, the abbreviation “US-52/SR-8” is used twice. Please correct.

Response:

Section 1.3.2 has been revised to delete the second “US-52/SR-8” abbreviation.

3. **Page 16, Section 3.3.2, first paragraph** – should sample WS-W5-53 be WS-SB-53?

Response:

Yes. Section 3.3.2 has been revised to reflect “WS-SB-53” as the correct sample designation.

4. **Page 20, Section 4.1** – Eliminate the gap in the second sentence.

Response:

The gap in the second sentence has been removed.

5. **Page 21, Section 4.2** – In the second paragraph, the document states the excavation of soil will take place on 4 properties with a total area of 4.6 acres, yet on page 20, the document states the soil removal areas encompass a total area of 3.6 acres. Please correct the discrepancy.

Response:

As stated in the response to NCDENR Comment #9, approximately 3.67 acres are to be excavated during removal activities. The first sentence of the second paragraph of Section 4.2 has been revised to reflect the correct removal area acreage.

6. **Page 22, Section 4.2.1** – In the first full paragraph, the document states that the areas with samples containing greater than 5 mg/L TCLP lead will be addressed either by stabilizing the soil or transporting the soil off-site for disposal. However, Figure 4-1A shows sample locations C-2, C-8, and SB-12 as areas that will not be addressed during the Removal Action. If these areas will not be addressed during the Removal Action, please add language to the document explaining why. If these areas will be addressed during the Removal Action, please modify Figure 4-1A to indicate that these areas will be addressed.

Response:

As presented in Table 3-1, soil samples collected from locations WS-SB-C2, WS-SB-C8, and WS-SB-12 contain concentrations of arsenic and lead below the NCDENR-determined site-specific screening levels of 22 mg/kg and 270 mg/kg for arsenic and lead, respectively; therefore, these areas will not be address during the removal action.

Note that waste characterization samples have different nomenclature than delineation soil sample locations. As stated in the third paragraph of Section 4.2.1, only waste characterization samples WS-WC-3, WS-WC-7, WS-WC-8, WS-11, WS-WC-12, and WS-WC-13 contained TCLP lead concentrations above 5.0 mg/L. As presented in Table 2-1, these waste characterization samples correspond to the following soil boring locations:

- WS-WC-3 was collected from location WS-SB-8;
- WS-WC-7 was collected from location WS-SB-9;
- WS-WC-8 was collected from location WS-SB-10;
- WS-WC-11 was collected from location WS-SB-41;
- WS-WC-12 was collected from location WS-SB-53; and
- WS-WC-13 was collected from location WS-SB-C4.

Figure 3-1 depicts a red circle around the soil boring symbol for these locations to designate that sample concentrations exceed TCLP lead criteria. As shown on Figure 4-1A, these areas will be addressed during the removal action.

The second paragraph of Section 3.4 and the third paragraph of Section 4.2.1 have been revised to clarify the waste characterization sampling results.

7. **Page 22, first sentence** – in the event a demarcation liner is used during the removal action, I recommend that language be added to the IC document which describes in detail the location and depths of the liner.

Response:

ARCADIS agrees with this recommendation. Section 5.5 of the SDR/RAWP text has been revised to include a bullet item stating that the institutional controls will provide the location, depth, and description of any demarcation liners used during the removal action.

8. **Page 22, last paragraph** – I recommend the groundwater investigation be completed at the Site, and a determination made regarding potential groundwater-use restrictions, before we generate an IC document for the Site.

Response:

The fourth paragraph of Section 4.1 has been revised to state that further evaluation of the extent and magnitude of groundwater impacts at the Site will be conducted by EMES following the completion of NCDOT construction activities and prior to the implementation of any institutional controls at the Site.

9. **Page 24, Section 5.1, 3rd paragraph** – A Post-Removal Site Control Plan needs to be developed which identifies all post-removal monitoring for the Site. The Post-Removal Site Control Plan will be reviewed and approved by EPA and NCDENR before the EPA approves the Final Removal Action Report for the Site.

Response:

The third paragraph of Section 5.1 has been revised to indicate the Post-Removal Site Control Plan Requirement. In addition, Section 5.4.2 "Post-Removal Site Control Plan" has been added to the Work Plan text to reiterate this reporting requirement.

10. **Figure 4-1A** – shows sample location "8-3" as a soil boring (collected by Hart and Hickman in 2009) with arsenic and/or lead above screening levels, but the sample location is not included in an area to be addressed during the removal action. Please explain why this location will not be addressed during the Removal Action. If the sample location will be addressed during the Removal Action, please modify Figure 4-1A to indicate that it will be addressed.

Response:

This location was mistakenly omitted from adjacent Removal Area 11. Figure 4-1A has been revised to include this sample location within the removal area. Table 5-1 and appropriate sections of the text have also been revised to reflect the correct surface area based on this revision.

RESPONSE TO NCDENR COMMENTS

1. **Section 1.2 Site Description and Background** – Please revise Section 1.2 to include a new separate section describing the North Carolina Department of Environment and Natural Resources (NC DENR) Inactive Hazardous Sites Branch (IHSB) Soil Remediation Goals (SRGs) for the Site-related constituents of concern (COCs), arsenic and lead.

The Preliminary Health Based Soil Remediation Goals (PSRGs) for arsenic and lead are 4.4 milligrams per kilogram (mg/kg) and 400 mg/kg, respectively. However, arsenic poses both carcinogenic risk and non-carcinogenic risk. The PSRG for arsenic is based on its non-carcinogenic properties. The PSRG for arsenic is also based on the assumption that there are four other chemicals at the Site in addition to the arsenic with the same critical effect. However, since there are no other COCs at the Site with the same critical effect, the PSRG for arsenic is actually 22 mg/kg (or 5x4.4mg/kg). This corresponds to a risk of 7 in 100,000 which is acceptable for residential usage. The PSRG for lead is based on United States Environmental Protection Agency (US EPA) guidance on lead cleanup levels and cannot be adjusted.

The Protection of Groundwater Soil Remediation Goals for arsenic and lead are 5.4 mg/kg and 270 mg/kg, respectively. Both health-based and protection of groundwater remediation goals must be met. However, the protection of groundwater remediation goals given in Guidelines for Assessment and Cleanup (NC DENR IHSB, October 2009) are only one alternative for achieving protection of groundwater criteria. Additional information on protection of groundwater remediation goals, procedures for adjusting preliminary remedial goals and other criteria that may affect remediation goals (e.g., ecological receptors, cross-media contamination) may be found in the Guidelines for Assessment and Cleanup. Since arsenic was not detected in groundwater above the groundwater standards promulgated under Chapter 2L, Title 15A of the North Carolina Administrative Code (15A NCAC 2L), the Protection of Groundwater Soil Remediation Goal for arsenic does not apply. However, since lead was detected in one groundwater sample above the 15A NCAC 2L groundwater standard for lead, the Protection of Groundwater Soil Remediation Goal for lead does apply. Furthermore, because the Protection of Groundwater Soil Remediation Goal for lead is more conservative than the Preliminary Health Based Soil Remediation Goal for lead, the Protection of Groundwater Soil Remediation Goal will be employed for lead.

Lastly, ExxonMobil Environmental Services Company (EMES) desires to accomplish all soil removal objectives required by both the US EPA and the NC DENR at the Site on a one-time basis to avoid future soil removal actions at the Site. Therefore, EMES has committed itself to

employing the NC DENR IHSB Preliminary Health Based Soil Remediation Goal for arsenic (22 mg/kg) and the NC DENR IHSB Protection of Groundwater Soil Remediation Goal for lead (270 mg/kg) as not only initial screening values but as final remediation goals for the Site.

Response:

Section 1.2.6 - *NCDENR Inactive Hazardous Sites Branch Soil Remediation Goals* has been created to include the provided text regarding NCDENR Inactive Hazardous Sites Branch (IHSB) Soil Remediation Goals (SRGs) for the Site-related constituents of concern (COCs), arsenic and lead. The List of Acronyms and Abbreviations at the beginning of the Work Plan has been updated to include acronyms used in Section 1.2.6.

2. **Section 1.3.1 Other Party Sampling** – Please revise the third sentence of the second paragraph of Section 1.3.1 to refer the reader to the new subsection in Section 1.2 – *Site Description and Background* for a complete description as to how the screening levels for lead and arsenic were determined.

Response:

The third sentence of Section 1.3.1 has been revised to refer the reader to Section 1.2.6 - *NCDENR Inactive Hazardous Sites Branch Soil Remediation Goals*.

3. **Section 1.3.2 November 2008 Soil Sampling** – Please revise the fourth paragraph of Section 1.3.2 to refer the reader to the new subsection in Section 1.2 – *Site Description and Background* for a complete description as to how the screening levels for lead and arsenic were determined.

Response:

The fourth paragraph of Section 1.3.2 has been revised to refer the reader to Section 1.2.6 - *NCDENR Inactive Hazardous Sites Branch Soil Remediation Goals*.

4. **Section 1.3.3 March 2009 Sampling (Hart & Hickman, PC)** – Please revise the second paragraph of Section 1.3.3 to refer the reader to the new subsection in Section 1.2 – *Site Description and Background* for a

complete description as to how the screening levels for lead and arsenic were determined.

Response:

The second paragraph of Section 1.3.3 has been revised to refer the reader to Section 1.2.6 - *NCDENR Inactive Hazardous Sites Branch Soil Remediation Goals*.

5. **Section 1.3.4 May 2009 RSE Sampling** – Please revise the third paragraph of Section 1.3.4 to refer the reader to the new subsection in Section 1.2 – *Site Description and Background* for a complete description as to how the screening levels for lead and arsenic were determined.

Response:

The third paragraph of Section 1.3.4 has been revised to refer the reader to Section 1.2.6 - *NCDENR Inactive Hazardous Sites Branch Soil Remediation Goals*.

6. **Section 3.2.1 Soil Standards** – Please revise the Section 3.2.1 to reiterate the information given in the above comment #1 for a complete description as to how the screening levels and ultimately the final soil remediation goals for lead and arsenic were determined for the Site.

Response:

Section 3.2.1 has been revised to reiterate the information given in Comment #1, which provides a complete description as to how the screening levels and final soil remediation goals for lead and arsenic were determined for the Site.

7. **Section 3.7 Investigation-Derived Waste Sampling and Disposal** – The first sentence of Section 3.7 indicates that a total of 25 drums (8 containing decontamination fluids/purge water and 17 containing soil/debris/personal protective equipment) were generated during the 2009 sampling activities at the Site. However, the Waste Manifest submitted as Appendix D – Waste Manifests indicates that a total of 23 drums (4 containing decontamination fluids, 3 containing purge water, 15 containing soil cuttings and 1 containing debris/personal protective equipment). Please clarify these discrepancies.

Response:

A cumulative total of 25 drums (8 containing decontamination fluids/purge water and 17 containing soil/debris/personal protective equipment [PPE]) were generated during 2009 sampling activities at the Site. A waste manifest for the two drums (1 containing decontamination fluids and 1 containing soil/PPE) generated during the May 2009 RSE sampling activities was included in the *Removal Site Evaluation Report, Former Virginia-Carolina Chemical Company Winston-Salem Site, Winston-Salem, Forsyth County, North Carolina* (ARCADIS 2009).

Section 3.7 has been revised to clarify that 23 drums (7 containing decontamination fluids/purge water and 16 containing soil/debris/PPE) were generated during October/November 2009 site delineation sampling activities. The first sentence of Section 2.6 has also been revised to specify that the 23 drums were generated during October/November 2009 site delineation sampling activities.

8. **Section 4.1 Introduction** - Please revise the third paragraph of Section 4.1 to indicate that although the impacts to groundwater at the Site are not considered significant, groundwater at the Site does exhibit the presence of lead in excess of the 15A NCAC 2L groundwater standards. Furthermore, please revise this section to indicate that the remedial objective for groundwater at the Site is to restore the groundwater to its beneficial use for consumptive purposes. Lastly, please revise this section to reflect that EMES fully intends to complete its investigation of the extent and magnitude of groundwater impacts to the Site from Site-related COCs upon the conclusion of NC Department of Transportation (NC DOT) construction activities at the Site.

Response:

Section 4.1 has been revised to indicate that groundwater at the Site does exhibit the presence of lead in excess of 15A NCAC 2L groundwater standards, and that EMES will continue its investigation of groundwater impacts at the Site following the completion of NC DOT construction activities at the Site.

9. **Section 4.2 Removal Action** - The first sentence of the second paragraph of Section 4.2 indicates that approximately 4.6 acres are to be excavated. However, the second sentence of the second paragraph of Section 4.1 indicates that approximately 3.6 acres are to be excavated. Please clarify this discrepancy.

Response:

Approximately 3.67 acres are to be excavated during removal activities. The first sentence of the second paragraph of Section 4.2 has been revised to reflect the correct removal area acreage.

10. **Section 5.3.7 Confirmation Sampling Plan – Base of Excavation Sampling** - This section indicates that individual confirmation samples will be collected from individual sub areas excavated to the same depth at a frequency not to exceed one sample (5-point composite) per 10,000 square feet of excavation. However this frequency does not appear to be robust enough. Please supplement this section with a table depicting the number of confirmation soil samples to be collected from each numbered sub area.

Response:

Table 5-2 (Summary of Confirmation Sampling Program) has been added to present the estimated number of confirmation soil samples to be collected from each removal area. Confirmation samples will be collected as 5-point composites at a frequency not to exceed one 5-point composite per 5,000 square feet of excavation. Each removal area will have a minimum of one 5-point composite sample. In addition the composite samples being submitted to the analytical laboratory for analysis of arsenic and lead, each individual composite aliquot will be screened in the field using an XRF to ensure it is below the Site-Specific Action Levels (SSALs). Table 5-2 has been prepared to list the estimated number of confirmation samples per removal area. Section 5.3.7 has been revised to refer the reader to Table 5-2.

11. **Table 3-1 Summary of Soil Sample Analytical Results - The Notes of Table 3-1** indicate that the shaded values exceed screening levels. However, the shading was inadvertently omitted. Please correct this oversight.

Response:

Shading of concentrations exceeding screening levels was not omitted; however, it has been observed that after reproduction of the hard copies of the report the shading is not clearly visible. Table 3-1 has been re-printed and presents clearly visible shading of concentrations exceeding screening levels.

12. **Table 3-2 Summary of Waste Characterization Analytical Results - The Notes of Table 3-2** indicate that the shaded values exceed screening levels. However, the shading was inadvertently omitted. Please correct this oversight.

Response:

Shading of concentrations exceeding screening levels was not omitted; however, it has been observed that after reproduction of the hard copies of the report the shading is not clearly visible. Table 3-2 has been re-printed and presents clearly visible shading of concentrations exceeding screening levels.

13. **Table 3-3 Summary of Groundwater Analytical Results and Field Parameter Measurements** – The Notes of Table 3-3 indicate that the shaded values exceed screening levels. However, the shading was inadvertently omitted. Please correct this oversight.

Response:

Shading of concentrations exceeding screening levels was not omitted; however, it has been observed that after reproduction of the hard copies of the report the shading is not clearly visible. Table 3-3 has been re-printed and presents clearly visible shading of concentrations exceeding screening levels.

14. **Appendix A – Visual Soil Classifications** – The Soil Boring Identification for SB-6 was inadvertently omitted. Please correct this oversight.

Response:

Appendix A has been revised to include the Soil Boring Identification for SB-6.

If you have any questions or comments, please feel free to contact me at 919.415.2308.

Sincerely,

ARCADIS

Description: US 52 Bridge Replacement over Liberty Street and NSRR
in Winston Salem

SUBJECT: NCDOT Comments on the Former Virginia Carolina Chemical Site Delineation
Report and Removal Action Work Plan

Dear Mr. Schmidt:

NCDOT and our consultant Hart and Hickman have reviewed the Site Delineation Report and Removal Action Work Plan dated January 2010. Our comments are detailed in the enclosed response prepared by Hart and Hickman and are summarized as follows:

- Impacted soils should be removed to approximately 1 to 2 feet below impacted areas.
- Post excavation confirmation samples should be analyzed for the specific PAHs and/or metals detected during the site assessment phase.
- Expand excavation Area 9 and Area 11 to address Environmental Investigation's Boring P8GP3 and Hart and Hickman's boring 8-3 respectively.
- Post excavation confirmation sampling should be performed at a higher frequency than proposed.

Sincerely,

Cyrus Parker, LG, PE

Dear Cyrus:

1.0 Introduction

As requested by the North Carolina Department of Transportation (DOT), Hart and Hickman, PC (H&H) is submitting this letter in response to recent changes in the North Carolina Department of Environment and Natural Resources – Inactive Hazardous Sites Branch (DENR - IHSB) Protection of Groundwater Soil Remediation Goals (POGSRGs) dated January 2010 and to provide comments on Arcadis' excavation work plan. The soil impacts are apparently related to two former fertilizer manufacturing facilities (Virginia Carolina Chemical (VCC) and Royster Clark) and a former ore processing facility (Carolina Ore). DENR has previously expressed a concern to NC DOT regarding removing or filling over impacted soils that are a threat to groundwater quality. H&H is providing comments on Arcadis' *Site Delineation Report and Removal Action Work Plan* (SDR and RAWP) dated January 2010 regarding removal of impacted soils on the former Virginia Carolina Chemical site and near the former Carolina Ore site (to the extent that those removal actions are relevant to NC DOT). A brief background for this project is discussed below.

2.0 Background

NCDOT is planning road improvements along US Highway 52 near the above-referenced parcels. The DOT project will require soil to be removed from certain areas in the ROW and placed in others (cut and fill areas, respectively). NC DOT is proposing to place soil (including impacted soil) in the road bed and road banks (fill areas) of the proposed Southbound Detour Lane, and the proposed northbound and southbound travel lanes in the VCC and non-VCC areas.

Environmental Investigations, Inc. (EI) completed Preliminary Site Assessments (PSAs) dated October 19, 2005 on Parcels 8, 9, 10 and 11. Impacted soils from historical site uses were identified in proposed DOT work areas on these properties during PSA activities. Based on these results, the primary contaminants of concern in DOT work areas are arsenic and lead. However, a number of other constituents were also detected in soil samples collected by EI and are discussed herein.

H&H completed assessment activities in proposed NC DOT right of ways on Parcel 8 to Parcel 11 in March and May 2009. The *Soil Investigation Report* prepared by H&H was submitted to DOT on June 12, 2009. Soil analytical results indicate there are concentrations of arsenic and lead above DENR target levels within proposed DOT work areas. NC DOT's overall plan for addressing these detections is presented in H&H's June 12, 2009 report.

On behalf of ExxonMobil, Arcadis advanced two soil borings in the VCC area in November 2008. Concentrations of lead and arsenic above target levels were detected in the soil samples collected from boring WS-EB2-D located on the western side of Highway 52 in the VCC area. Arcadis completed additional soil sampling in the VCC area in May 2009. Soil analytical results indicated concentrations of arsenic and lead above DENR target levels in the VCC area. Results of the May 2009 assessment activities are provided in Arcadis *Removal Site Evaluation Report* dated August 2009. Arcadis completed additional soil assessment in

October and November 2009 to further delineate soil impacts and to develop a removal action strategy for impacted soils associated with the VCC site. Five monitoring wells were also installed to assess potential impacts to groundwater in the VCC area. Arcadis November and October 2009 assessment data and the removal action work plan for impacted soil in the VCC area are presented in Arcadis' SDR and RAWP dated January 2010.

H&H has reviewed historical assessment data conducted at the site by EI (for NC DOT), H&H (for NC DOT), and Arcadis (for ExxonMobil). The primary contaminants of concern in DOT work areas are arsenic and lead. Based on the new POGSRG for arsenic, many of the soil samples previously collected in the VCC and non-VCC areas contained arsenic concentrations that exceed the new POGSRG for arsenic. However, groundwater data collected by Arcadis in the downgradient portion of the VCC area do not indicate the presence of arsenic above groundwater standards. Therefore, arsenic does not appear to be leaching to groundwater in or near the VCC area, and the POGSRG for arsenic does not apply in that area.

Several other contaminants of concern (not just arsenic and lead) were detected in soil samples collected by EI above their respective POGSRGs in the VCC and non-VCC areas including volatile organic compounds (VOCs), PAHs, and other metals. A copy of the new POGSRG table is included in Appendix A. Relevant POGSRGs are discussed in Section 3.0. H&H comments relevant to Arcadis SDR and RAWP are discussed in Section 4.0.

3.0 Previous Assessment Data Evaluation – VCC and Non-VCC Area

H&H compared historical soil analytical data collected by EI and H&H from Parcels 8 through Parcel 11 to the new POGSRGs. As discussed in Table 1, H&H evaluated the potential for contaminants above the POGSRG to be a threat to groundwater to determine 1) if impacted soil can be used as beneficial fill soil in the nearby proposed Southbound Detour Lane and the proposed northbound and southbound travel lanes and 2) if remaining impacted

soils that are a threat to groundwater may be rendered inaccessible by proposed DOT filling activities.

Soil samples collected by EI and H&H with arsenic detections above the new POGSRG are located on Parcel 8 near the VCC area, near the bridge foundation wall (between Parcel 8 and 9), near the northeastern boundary of the Royster Clark property, and on the east side of Highway 52 on Parcel 9. Based on historical arsenic TCLP leachate analytical results and recent Arcadis groundwater sampling analytical results, arsenic does not appear to be a significant threat to groundwater in these areas. However, because arsenic was previously detected in groundwater samples collected from monitoring wells on the Royster Clark property, additional groundwater sampling for arsenic is recommended to attempt to show that arsenic in soil is not a threat to groundwater near the Royster Clark site. Existing Royster Clark monitoring wells MW-3, MW-5, and/or MW-9 may be available to evaluate arsenic in groundwater. Low turbidity samples should be collected for arsenic analysis. Arsenic results from the groundwater sampling previously conducted by RMT Integrated Environmental Solutions (RMT) on the Royster Clark facility are included in Appendix B.

Other contaminants of concern detected in soil samples collected by EI above the POGSRGs include PCE and selenium. As discussed in Table 1, PCE and selenium do not appear to pose a significant threat to groundwater. Additionally, various metals and VOCs were detected in soil samples above their respective POGSRGs on Parcel 9 and Parcel 11. However, the location of these soil samples are outside of DOT cut and fill work areas, and soils will not be disturbed in those areas.

Specific sample locations, concerns, and evaluations of the above mentioned contaminants are provided in Table 1. EI soil sample locations and analytical results are presented on EI's PSA tables and figures included Appendix C. H&H soil sample locations and analytical results are included in H&H's *Soil Investigation Report* dated June 12, 2009.

4.0 Review of Arcadis' Work Plan Relevant to DOT

H&H has reviewed Arcadis' SDR and RAWP and has prepared these comments based on historical assessment activities conducted at the site (Table 2). Based on Arcadis' SDR and RAWP, arsenic and lead impacted soils will be excavated to various depths within thirteen individual sub-areas in the VCC area and near the former Carolina Ore site. Once impacted soils are removed, soil will be field screened to confirm that impacts have been removed prior to post-excavation soil confirmation sampling and subsequent backfilling. Laboratory confirmation sampling will include analysis for arsenic and lead. H&H's comments provided in Table 2 are presented as they relate to Arcadis proposed impacted soil removal and DOT work areas.

As discussed in Table 2, H&H compared previous assessment data above the POGSRGs and depths of impacted soil to the horizontal and vertical limits of Arcadis proposed soil removal sub-areas. Based on historical assessment data, there are two impacted soil areas located on the west side of Highway 52 in the VCC area where no excavation activities are proposed by Arcadis. Additionally, there are impacted soil areas near the proposed piping on Parcel 8 and Parcel 9 where Arcadis proposed excavation sub-areas do not extend to the depth of impacts or the proposed excavation sub-area ends at the depth of the impacted sample location. Arcadis proposed depth of soil removal is 2 ft near the magenta colored soils. Although the depth and extent of the magenta soils are not defined, Arcadis indicated that they will be excavating the magenta colored soils. Additionally, historical soil sample analytical data indicate that various PAHs and metals were detected above POGSRGs in several soil samples previously collected in the VCC area; however, Arcadis confirmation sampling only includes analysis for arsenic and lead.

Based on these concerns, DOT should ask ExxonMobil to remove impacted soils to approximately 1 to 2 ft below each of the impacted areas as described in Table 2. Because various PAHs and other metals concentrations were detected in several sample locations,

DOT should ask ExxonMobil to include analysis for the specific PAHs and/or metals detected at each location during post excavation confirmation sampling. H&H also recommends that Arcadis collect post-excavation confirmation samples at a higher frequency than proposed to ensure that impacted soils have been adequately removed from the site.

Deep arsenic impacts (in WS-EB2-D 38.5 to 40 ft) were also previously identified beneath the western side of Highway 52 near in the VCC area. Due to the location and depth of impacts in this boring, it is not feasible to remove arsenic impacted soil below the existing highway. There was also a minor lead detection (278 mg/kg) in a shallow soil sample collected from WS-EB2-D that will not be excavated. There are no other known impacts below Highway 52 and no soil removal is planned under Highway 52 or its embankments during DOT road improvements. In addition, groundwater arsenic and lead data collected by Arcadis downgradient of the existing Highway 52 did not contain impacts that would suggest that soils beneath the existing Highway 52 are a significant threat to groundwater.

Specific sample locations and soil removal area concerns and evaluations are presented in Table 2. Historical EI tables and figures are included Appendix C. Relevant tables and figures from Arcadis SDR and RAWP are included in Appendix D.

5.0 Summary

H&H has reviewed historical assessment data conducted in the VCC and non-VCC areas on Parcels 8 through Parcel 11. Based on H&H's evaluation, contaminants above their respective POGSRGs are not likely to be a threat to groundwater. However, because arsenic was detected in groundwater samples near the Royster Clark property, additional groundwater sampling for arsenic is recommended to attempt to show that arsenic in soil is not a threat to groundwater in the area of the former Royster Clark facility.

Mr. Cyrus Parker
February 3, 2010
Page 7

H&H has also provided comments on Arcadis SDR and RAWP. Based on review of Arcadis proposed excavation sub-areas in the VCC area, additional soil removal should be conducted in several locations. Confirmation sampling should be conducted at a higher frequency and include specific analyses for all constituents previously detected above DENR target levels.

Should you have questions or require additional information, please do not hesitate to contact us at 704.586.0007.

VCC Area and Non-VCC Area Data Evaluation
State Project U-2826A - WBS Element 34871.1.1
Winston-Salem, North Carolina
H&H Job No. ROW-204

Area	Parcel	Concern	Evaluation
VCC Area	Parcel 8	Arsenic detections soil samples 8-3 (8.8 mg/kg) and 8-4 (8.3 mg/kg) collected by Hart & Hickman (H&H) on the west side of Highway 52 exceed the POGSRG (5.8 mg/kg).	According to Arcadis <i>Site Delineation Report and Removal Action Work Plan</i> dated January 2010, no arsenic was detected in downgradient monitoring well MW-4 sampled in November 2009. Based on these data arsenic does not appear to be a threat to groundwater.
VCC Area	Parcel 8	Detections of arsenic in shallow soil samples P8HA36 (6.55 mg/kg) and P8HA39 (9.43 mg/kg) collected by Environmental Investigations, Inc. (EI) on the west side of Highway 52 near the proposed drainage piping area exceed the POGSRG (5.8 mg/kg).	According to Arcadis <i>Site Delineation Report and Removal Action Work Plan</i> dated January 2010, no arsenic was detected in downgradient monitoring well MW-2 sampled in November 2009. Based on these data arsenic does not appear to be a threat to groundwater.
VCC Area	Parcel 8	PCE (0.00919 mg/kg) detected in P8GP11 (18-19 ft) on Parcel 8 exceeds the POGSRG (0.005 mg/kg).	The concentration of PCE does not exceed 20*2L Standard (0.014 ppm).
Royster Clark	Parcel 10 and the Waste Management Property	<p>Arsenic detections ranging from 5.9 mg/kg to 27 mg/kg in soil samples collected by EI and H&H near the northeastern boundary of the Royster Clark property exceed the POGSRG (5.8 mg/kg). Soil samples include P10HA6, P11GP8, P11GP11, and P11HAR (P11GPR on EI map) collected by EI and soil samples collected from soil borings, 10-2 through 10-6 and 10-9 through 10-16 collected by H&H.</p> <p>Based on RMT Integrated Environmental Solutions (RMT) <i>Results of the June 2004 Groundwater and Surfacewater Sampling Activities</i> report dated August 31, 2004, arsenic was detected in monitoring wells MW-5, MW-6, and MW-9, located on the Royster Clark property near the subject soil sample locations, above the NC 2L Standard (0.010 mg/L).</p> <p>The arsenic exceedances reported in MW-5 (0.035 mg/L), MW-6 (0.056 mg/L), and MW-9 (0.25 mg/L) may be due to the high turbidity readings measured in each of the collected samples, 700 nephelometric turbidity units (NTUs), 580 NTUs, and 55 NTUs, respectively.</p>	<p>During H&H field activities, the soil sample with the highest arsenic concentration collected in the Royster Clark area was analyzed for TCLP RCRA metals. Arsenic was not detected in the leachate of the sample indicating that arsenic does not appear to be a threat to groundwater (TCLP detection limits were above GW standards). However, because arsenic was detected in nearby monitoring wells in 2004, potentially due to high turbidity readings, these wells should be sampled by DOT with an effort made to obtain field measured turbidity values of less than 10 NTUs to further show that arsenic detected in soils near Royster Clark are not a threat to groundwater.</p>
Bridge Foundation Wall	Between Parcel 8 and Parcel 9	Arsenic detections ranging from 6.1 mg/kg to 29 mg/kg in soil samples collected from borings BFW-1 through BFW-6 by (H&H) near the existing Bridge Foundation Wall exceed the POGSRG (5.8 mg/kg).	During H&H field activities, the samples (BFW-5 0.5 ft and BFW-5 2 ft) with the highest arsenic concentrations collected near the Bridge Foundation Wall were analyzed for TCLP RCRA metals. Arsenic was not detected in the leachate of the samples indicating that arsenic does not appear to be a threat to groundwater. Additionally, because arsenic was not detected in downgradient monitoring well MW-4 during Arcadis November 2009 sampling event, arsenic does not appear to be a threat to groundwater in this area.

Table 1 (Page 2 of 3)
VCC Area and Non-VCC Area Data Evaluation
State Project U-2826A - WBS Element 34871.1.1
Winston-Salem, North Carolina
H&H Job No. ROW-204

Area	Parcel	Concern	Evaluation
Royster Clark & Atlantic Scrap and Processing, LLC	Parcel 9 and Parcel 11	Selenium detections in soil samples P9GP21 (2.73 mg/kg), P9GP22 (2.22 mg/kg), P9GP23 (2.59 mg/kg), and P9GP25 (2.52 mg/kg) on Parcel 9 and P11GP8 (3.37 mg/kg) collected by EI exceed the POGSRG (5.8 mg/kg).	1995 groundwater data collected at Royster Clark (MW-3) does not indicate selenium impacts in groundwater. Well MW-3 is within 100 ft of the highest selenium detection in soil (P11GP8).
Atlantic Scrap and Processing, LLC	Parcel 9	PCE (0.0102 mg/kg) detected in P9GP-41 (16 ft) collected by EI on the east side of Highway 52 (Parcel 9) exceeds the DENR IHSB POG (0.005 mg/kg).	The concentration of PCE does not exceed 20*2L Standard (0.014 ppm).
Atlantic Scrap and Processing, LLC	Parcel 9	Arsenic (7.01 mg/kg) and lead (343 mg/kg) detected in P9GP23 (14 ft) collected by EI on the east side of Highway 52 (Parcel 9) exceed the POGSRGs (5.8 mg/kg and 270 mg/kg, respectively).	Utilize arsenic data from the resampling of upgradient wells MW-5, MW-6 and MW-9 located on the Royster Clark property to show that arsenic in this area is not a threat to groundwater. Additionally, H&H evaluated the potential for detected leachate concentrations to impact ground water in samples that were analyzed for TCLP RCRA metals during H&H field activities. The highest detected TCLP concentration (0.26 mg/L) exceeds the 2L Standard of 0.015 mg/L. Using a default ground water dilution attenuation factor of 20 the resulting lead concentration in ground water (0.013 mg/L) is lower than the 2L standard. Based on these data, lead impacts do not appear to be a threat to ground water.
Project Area	Parcel 8 to Parcel 11	A limited number of chromium detections ranging from 1.14 mg/kg to 49.7 mg/kg were reported in samples collected by EI across the project area.	Literature values indicate the average chromium background concentration in North Carolina is 65 mg/kg. There are no detections above the published value for chromium and detections at the site do not exceed the screening level for chromium III. H&H has no reason to believe that hexavalent chromium may be present. Based on available data, chromium is naturally occurring. Published chromium detections taken from Elements in North American Soils Second Edition, 2005.

State Project U-2826A - WBS Element 34871.1.1
Winston-Salem, North Carolina
H&H Job No. ROW-204

Area	Parcel	Concern	Evaluation
<p align="center"> Waste Management and Atlantic Scrap and Processing, LLC </p>	<p align="center"> Parcel 9 and 11 </p>	<p> Parcel 9 Arsenic and lead detected in EI samples P9GP6 - 2 ft (8.51 mg/kg and 303 mg/kg) and P9GP11 - 1 ft (134 mg/kg and 2,000 mg/kg) exceed POGSRGs (5.8 mg/kg and 270 mg/kg, respectively). Arsenic detected in EI samples P9GP33-14 ft (5.92 mg/kg) and P9GP39-5 ft (8.76mg/kg) exceed the POGSRG (5.4 mg/kg). PCE (0.0695 mg/kg) detected in EI sample P9GP40 (5 - 6 ft) exceeds the POGSRG (0.005 mg/kg). Selenium detections in samples P9GP6, P9GP32, P9GP38, P9GP39, P9GP40, P9GP45 ranging from 2.18 mg/kg to 2.87 mg/kg collected by EI exceed the POGSRG (2.1 mg/kg). Parcel 11 Arsenic (12.7 mg/kg), PCE (0.00941 mg/kg), and 1,2-dichloropropane (0.0141 mg/kg) detected in EI sample P11GP4 (20 ft) exceed POGSRGs (5.8 mg/kg, 0.0050 mg/kg and 0.0033 mg/kg, respectively) Selenium detction in P11GP3 (3.51 mg/kg) collected by EI exceeds the POGSRG (2.1 mg/kg). </p>	<p> The locations of these soil samples are outside of DOT cut and fill work areas. </p>

Table 2 (Page 1 of 3)
Review of Arcadis Work Plan Relevant to NC DOT
State Project U-2826A - WBS Element 34871.1.1
Winston-Salem, North Carolina
H&H Job No. ROW-204

Concern	Evaluation
Lead detection (310 mg/kg) in soil sample 8-3 0.5 ft collected by H&H on the west side of Highway 52 in the VCC area on Parcel 8 exceeds the POGSRG (270 mg/kg).	Arcadis is removing impacted soils to a depth of 2 ft approximately 20 ft to the east of this location; however, no excavation is planned at sample location 8-3. A concentration of lead (0.11 mg/L) was also detected in the TCLP leachate that was analyzed from sample 8-3 above the 2L Standard (0.015 mg/L). However, using a default groundwater attenuation factor of 20 the potential lead concentration in groundwater (0.0055 mg/L) is below the 2L Standard. Additionally, no lead concentrations were detected above the DENR IHSB POG in nearby Arcadis sample SB-C8. Although the lead concentration from boring 8-3 does not appear to be a threat to groundwater, DOT should ask ExxonMobil to excavate impacted soil to a depth of 1 - 2 ft at sample 8-3 (0.5 ft).
Arsenic (7.3 mg/kg) and lead (342 mg/kg) detections in soil sample P8GP3 (8 ft) collected by EI near the proposed drainage piping in the VCC area on Parcel 8 exceeds POGSRGs (5.8 mg/kg and 270 mg/kg, respectively).	Arcadis is removing impacted soils to a depth of 7 ft in the nearby proposed piping area; however, no excavation is planned near EI sample location P8GP3. DOT should ask ExxonMobil to excavate impacted soil to a depth of 9 - 10 ft in this area and collect post excavation confirmation samples for analysis of arsenic and lead.
Lead detections in H&H soil sample 8-16 (1,500 mg/kg - 2 ft and 1,100 mg/kg - 7 ft) on Parcel 8 and sample 9-1 (860 mg/kg - 5 ft) on Parcel 9 exceed the POGSRG (270 mg/kg).	Arcadis plans to excavate impacted soils in these areas to depths of 7 ft on Parcel 8 and 5 ft on Parcel 9. DOT should ask ExxonMobil to excavate soils at least 1 ft below the depths of previously detected impacts in these areas prior to collection of confirmation samples.
The lead detection (348 mg/kg) in soil sample P9GP14 (14 ft) collected by EI in the VCC area on Parcel 9 exceeds the POGSRG (270 mg/kg).	Arcadis is removing impacted soils to a depth of 5 ft in this area; however, the depth of the lead impacted soil is 14 ft bgs. DOT should ask ExxonMobil to further evaluate the potential for lead leaching at P9GP14 or excavate impacted soil to a depth of 15 to 16 ft in this area.
Detections of naphthalene (0.735 mg/kg), arsenic (355 mg/kg), barium (1,450 mg/kg), lead (3,010 mg/kg), selenium (3.61 mg/kg), and silver (14 mg/kg) were detected in soil sample P9GP13 (13 -14 ft) collected by EI near the proposed piping area on Parcel 9 above their respective POGSRGs (0.21 mg/kg, 5.8 mg/kg, 580 mg/kg, 270 mg/kg, 2.1 mg/kg, and 3.4 mg/kg, respectively).	Arcadis is only removing impacted soils to a depth of 5 ft in this area and confirmation sampling will only include analyses for arsenic and lead. DOT should ask ExxonMobil to further evaluate these detections via sampling or to excavate impacted soils to a depth of 15 to 16 ft. DOT should also ask ExxonMobil to include analysis for naphthalene and analysis for barium, selenium, and silver in post excavation confirmation samples collected in this area.

Table 2 (Page 2 of 3)
Review of Arcadis Work Plan Relavent to NC DOT
State Project U-2826A - WBS Element 34871.1.1
Winston-Salem, North Carolina
H&H Job No. ROW-204

Concern	Evaluation
<p>Various PAHs including benzo[a]anthracene (5.95 mg/kg), benzo[a]pyrene (7.56 mg/kg), benzo[b]fluoranthene (9.01 mg/kg), dibenzo[a,h]anthracene (9.66 mg/kg), and indeno(1,2,3-cd)pyrene (4.6 mg/kg) exceed their POGSRGs (0.18 mg/kg, 0.059 mg/kg, 0.60 mg/kg, 0.19 mg/kg, and 2.0 mg/kg, respectively) in soil sample P9GP1 (3 ft) collected by EI near the Bridge Foundation Wall on Parcel 9. Metals including arsenic (551 mg/kg), barium (1,540 mg/kg), lead (4,140 mg/kg), mercury (7.87 mg/kg), selenium (6.39 mg/kg), and silver (9.08 mg/kg) were also detected above their POGSRGs (5.8 mg/kg, 580 mg/kg, 270 mg/kg, 1.0 mg/kg, 2.1 mg/kg, and 3.4 mg/kg, respectively) in sample P9GP1.</p>	<p>Arcadis is removing impacted soils to a depth of 4 ft in this area; however, confirmation sampling will only include analyses of arsenic and lead. DOT should ask ExxonMobil to include analyses for the specific PAHs and metals that are above their respective POGSRGs in post excavation confirmation samples collected in this area.</p>
<p>Metals including arsenic (48.8 mg/kg), lead (12,300 mg/kg), and selenium (10.5 mg/kg) were detected in soil sample P9GP7 (3 ft) collected by EI in the VCC area on Parcel 9 exceed their respective POGSRGs (5.8 mg/kg, 270 mg/kg, and 2.1 mg/kg, respectively).</p>	<p>Arcadis is removing impacted soils to a depth of 4 ft in this area; however, confirmation sampling will only include analyses for arsenic and lead. DOT should ask ExxonMobil to include analysis for selenium in post excavation confirmation samples collected in this area.</p>
<p>Detections of selenium ranging from 3.03 mg/kg to 4.3 mg/kg in shallow samples P9GP2-1 ft, P9GP3-2 ft, P9GP10-1 ft, and P9GP11-1 ft collected by EI are above the POGSRG (2.1 mg/kg).</p>	<p>Arcadis is removing impacted soils in these areas; however, confirmation sampling will only include analyses for arsenic and lead. DOT should ask ExxonMobil to include analysis for selenium in post excavation confirmation samples collected in these areas.</p>
<p>Magenta colored soils and slag material near the former Carolina Ore ruins on Parcel 9.</p>	<p>Arcadis is removing impacted soils to a depth of 2 ft in this area; however, the depth of the impacted soils may extend beyond 2 ft bgs. DOT should ask ExxonMobil to excavate the vertical extent of impacted magenta colored soils in this area.</p>
<p>Concentrations of lead (278 mg/kg) and arsenic (121 mg/kg) were detected in Arcadis soil sample WS-EB2-D at 3 to 5 ft and 38.5 to 40 ft bgs, respectively, above their POGSRGs (5.8 mg/kg and 270 mg/kg, respectively). Soil boring WS-EB2-D is located along the western side of Highway 52 in the VCC area.</p>	<p>Due to the location and depth of impacts in boring WS-EB2-D, it is not feasible to remove impacted soil below the existing highway. There are no other known impacts below Highway 52 and no soil removal is planned under Highway 52 or its embankments during DOT road improvements.</p>

DENR – IHSB – Soil Remediation Goals

**INACTIVE HAZARDOUS SITES BRANCH
SOIL REMEDIATION GOALS (SRG)
JANUARY 2010**

Both health-based and protection of groundwater remediation goals must be met. The protection of groundwater remediation goals listed on this table are only one alternative for achieving protection of groundwater criteria. Please refer to REC or State-lead Guidance documents for additional information on protection of groundwater remediation goals, procedures for adjusting preliminary remedial goals and other criteria that may affect remediation goals (e.g. ecological receptors, cross-media contamination). In addition, if sensitive environments are present, the branch may require the adjustment of remediation goals and/or the proposed remedial alternative.

SOIL REMEDIATION GOALS (SRG)
JANUARY 2010**

Both health-based and protection of groundwater remediation goals must be met. The protection of groundwater remediation goals listed on this table are only one alternative for achieving protection of groundwater criteria. Please refer to REC or State-lead Guidance documents for additional information on protection of groundwater remediation goals, procedures for adjusting preliminary remedial goals and other criteria that may affect remediation goals (e.g. ecological receptors, cross-media contamination). In addition, if sensitive environments are present, the branch may require the adjustment of remediation goals and/or the proposed remedial alternative.

Xylene, o-	95-47-6	4.3E+02	Csat		6.0E+00	3
Zinc (Metallic)	7440-66-6	4.7E+03	N		1.2E+03	3
Zinc Phosphide	1314-84-7	4.7E+00	N			
Zineb	12122-67-7	6.1E+02	N			

- * - Contaminant exhibits both carcinogenic and non-carcinogenic effects. The lower of the carcinogenic remediation goal at 1.0E-06 risk or the non-carcinogenic remediation goal at a hazard quotient of 0.2 is listed.
- 1 - Preliminary Soil Remediation adapted from the December 2009 USEPA Regional Screening Tables. Cleanup below method detection limits using analytical methods prescribed in the guidelines, is not required.
- 2 - Developed using a soil leachate model using default values appropriate for North Carolina (see pg. 18). For chemicals with no protection of groundwater remediation goal call the Branch or refer to the guidance.
- 3 - Based on North Carolina 2L as target groundwater concentration.
- 4 - Based on North Carolina Interim 2L as target groundwater concentration.
- 5 - The arsenic value is the non-carcinogenic value because the carcinogenic value is below the laboratory method detection limit (MDL).
- 6 - Adjustment may result in exceedance of the soil saturation concentration (C_{sat}). Check the USEPA Regional Screening Level table for soil saturation concentration (C_{sat}) values when adjusting.
- 7 - The preliminary remediation goals for dioxins and furans can also be calculated as a toxic equivalency concentration (TEQ) by using the toxicity equivalence factor (TEF) methodology. (See TEF table for dioxins and furans.)
- 8 - The SRG is based on USEPA guidance on lead cleanup levels. The value cannot be adjusted.
- 9 - The SRG is based on USEPA policy for cleanup of PCBs at Superfund Sites. The Branch is currently reviewing the PCB remediation goal policy and may issue further guidance at a later date.
- 10 - Remediation goals for carcinogenic PAHs can also be calculated as a toxic equivalency concentration (TEQ) by using the toxicity equivalence factor (TEF) methodology. (See TEF table for carcinogenic PAHs.)
- 11 - C - The PSRG is based on the carcinogenic endpoint and corresponds to an excess lifetime cancer risk of 1 in 1,000,000.
N - The PSRG is based on the non-carcinogenic endpoint and corresponds to a hazard quotient of 0.2.
M - Contaminant is a mutagen.
C_{sat} - Soil Saturation Concentration.

N/A- Not available.

Transport Model Used to Calculate Protection of Groundwater Remediation Goals²

$$C_{soil} = C_{gw} \left[k_s + \frac{(\theta_w + \theta_a H')}{P_b} \right] df$$

	<u>Parameters</u>	<u>Default Values</u>	<u>Units</u>
C_{soil}	Calculated Source Concentration for soil	not applicable	mg/kg - soil
C_{gw}	Applicable Groundwater Target Concentration (NC GW Std)	chemical-specific	mg/L - water
Df	Dilution factor (see equation 2)	20 (0.5 acre source size) ²	unitless
K_s	Soil-water partition coefficient for organic constituents $k_s = k_{oc} f_{oc}$ for inorganic constituents $k_s = k_d$	chemical-specific	L/kg
k_{oc}	Soil organic carbon-water partition coefficient	chemical-specific	L/kg
f_{oc}	Fraction of organic carbon in subsurface vadose soils	0.001 (0.1%)	kg/kg
K_d	Soil-water partition coefficient for inorganics	chemical-specific (pH=5.5)	L/kg
θ_w	Water-filled soil porosity-vadose soils	0.3	L_{water}/L_{soil}
θ_a	Air-filled soil porosity-vadose soils	0.13	L_{air}/L_{soil}
P_b	Dry bulk density	1.5	kg/L
H'	Henry's Law constant-dimensionless where: H' = Henry's Law constant (atm-m ³ /mole) x conversion factor of 41	chemical-specific	unitless

1. From the USEPA 1996 Soil Screening Guidance
2. Default value from the USEPA 1996 Soil Screening Guidance

RE: Request for a Time-Critical Removal Action
Former Virginia-Carolina Chemical Company Winston-Salem Site
Winton-Salem, Forsyth County, North Carolina

Dear Mr. Mallary:

The North Carolina Department of Environment and Natural Resources (NC DENR) Superfund Section has received the *Request for a Time-Critical Removal Action* for the Former Virginia-Carolina Chemical Company Winston-Salem Site. The NC DENR Superfund Section has reviewed this document and offers the following attached comments.

The NC DENR Superfund Section appreciates the opportunity to comment on this document. If you have any questions or comments, please feel free to contact me at (919) 508-8466 or at david.mattison@ncdenr.gov.

Sincerely,

David B. Mattison
Environmental Engineer
NC DENR Superfund Section

FORMER VIRGINIA-CAROLINA CHEMICAL COMPANY WINSTON-SALEM SITE Request for a Time-Critical Removal Action

II. Site Conditions and Background

A. Site Description

1. Removal Site Evaluation

1. Please revise Section II.A.1. to include a new separate section describing the North Carolina Department of Environment and Natural Resources (NC DENR) Inactive Hazardous Sites Branch (IHSB) Soil Remediation Goals (SRGs) for the Site-related constituents of concern (COCs), arsenic and lead.

The Preliminary Health Based Soil Remediation Goals (PSRGs) for arsenic and lead are 4.4 milligrams per kilogram (mg/kg) and 400 mg/kg, respectively. However, arsenic poses both carcinogenic risk and non-carcinogenic risk. The PSRG for arsenic is based on its non-carcinogenic properties. The PSRG for arsenic is also based on the assumption that there are four other chemicals at the Site in addition to the arsenic with the same critical effect. However, since there are no other COCs at the Site with the same critical effect, the PSRG for arsenic is actually 22 mg/kg (or 5x4.4mg/kg). This corresponds to a risk of 7 in 100,000 which is acceptable for residential usage. The PSRG for lead is based on United States Environmental Protection Agency (US EPA) guidance on lead cleanup levels and cannot be adjusted.

The Protection of Groundwater Soil Remediation Goals for arsenic and lead are 5.4 mg/kg and 270 mg/kg, respectively. Both health-based and protection of groundwater remediation goals must be met. However, the protection of groundwater remediation goals given in *Guidelines for Assessment and Cleanup* (NC DENR IHSB, October 2009) are only one alternative for achieving protection of groundwater criteria. Additional information on protection of groundwater remediation goals, procedures for adjusting preliminary remedial goals and other criteria that may affect remediation goals (e.g., ecological receptors, cross-media contamination) may be found in the *Guidelines for Assessment and Cleanup*. Since arsenic was not detected in groundwater above the groundwater standards promulgated under Chapter 2L, Title 15A of the North Carolina Administrative Code (15A NCAC 2L), the Protection of Groundwater Soil Remediation Goal for arsenic does not apply. However, since lead was detected in one groundwater sample above the 15A NCAC 2L groundwater standard for lead, the Protection of Groundwater Soil Remediation Goal for lead does apply. Furthermore, because the Protection of Groundwater Soil Remediation Goal for lead is more conservative than the Preliminary Health Based Soil Remediation Goal for lead, the Protection of Groundwater Soil Remediation Goal will be employed for lead.

Lastly, ExxonMobil Environmental Services Company (EMES) desires to accomplish all soil removal objectives required by both the US EPA and the NC DENR at the Site on a one-time basis to avoid future soil removal actions at the Site. Therefore, EMES has committed itself to employing the NC DENR IHSB Preliminary Health Based Soil Remediation Goal for arsenic (22 mg/kg) and the NC DENR IHSB Protection of Groundwater Soil Remediation Goal for lead (270 mg/kg) as not only initial screening values but as final remediation goals for the Site.

4. **Release or Threatened Release into the Environment of a Hazardous Substance, or Pollutant or Contaminant**
2. Please revise the second paragraph of Section II.A.4. to refer the reader to the new section in Section II.A.1. – *Removal Site Evaluation* for a complete description as to how the screening levels for lead and arsenic were determined.

III. Threats to Public Health or Welfare or the Environment and Statutory and Regulatory Authorities

A. Threats to Public Health or Welfare

3. Please revise Section III.A. to refer the reader to the new section in Section II.A.1. – *Removal Site Evaluation* for a complete description as to how the screening levels for lead and arsenic were determined.

V. Proposed Actions and Estimated Costs

A. Proposed Actions

1. Description of Proposed Response Actions

4. Please revise the third paragraph of Section V.A.1. to definitively include provisions for the placement of Institutional Controls (i.e., a restrictive covenant) to the Site property. Although the exact restrictions and language have not been determined by the US EPA or the NC DENR, the presence of lead and arsenic contamination beneath US Highway 52/State Road-8, and the inability to remediate such contamination, necessitate the need for Institutional Controls to ensure the long-term protection of human health and the environment at the Site, as well as to ensure the integrity of the Time-Critical Removal Action is not jeopardized by future construction and/or redevelopment activities at the Site.

VII. Outstanding Policy Issues

5. Please revise the fourth paragraph of Section VII. to definitively include provisions for the placement of Institutional Controls (i.e., a restrictive covenant) to the Site property. Although the exact restrictions and language have not been determined by the US EPA or the NC DENR, the presence of lead and arsenic contamination beneath US Highway 52/State Road-8, and the inability to remediate such contamination, necessitate the need for Institutional Controls to ensure the long-term protection of human health and the environment at the Site, as well as to ensure the integrity of the Time-Critical Removal Action is not jeopardized by future construction and/or redevelopment activities at the Site.

ENFORCEMENT ACTION MEMORANDUM

Subject: Request for a Time-Critical Removal Action at the former Virginia Carolina Chemical Company ~~operation~~ Site, Winston-Salem, Forsyth County, North Carolina

From: Tim Neal, On-Scene Coordinator
Emergency Response and Removal Branch

McKenzie Mallary, Remedial Project Manager
Superfund Remedial and Site Evaluation Branch

Thru: Shane Hitchcock, Chief
Emergency Response and Removal Branch

To: Franklin E. Hill, Director
Superfund Division

I. Purpose

The purpose of this Action Memorandum, pursuant to Section 104 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), is to request and document approval of the proposed enforcement-lead Time-Critical Removal Action described herein for the former Virginia-Carolina Chemical Company (VCC) Site ("the Site"), located in Winston-Salem, Forsyth County, North Carolina. The Site poses a potential threat to public health and the environment that meets the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) Section 300-415(b) (2) criteria for a Time-Critical Removal Action. ExxonMobil Oil Corporation, subsidiary to Exxon Mobil Corporation, is the corporate successor to VCC Corporation. This Removal Action will be enforcement-lead pursuant to an Administrative Order on Consent (AOC) with ExxonMobil Corporation.

II. SITE CONDITIONS AND BACKGROUND

A. Site Description

Site ID#: A4YD
Type: Time Critical Removal Action

The Site is the location of a former phosphate fertilizer plant in Winston-Salem, North Carolina. The plant was constructed by Southern Chemical Company between 1895 and 1900, and was continuously operated through 1927.

Phosphate fertilizer manufacturing at the Site generally involved reacting phosphate ores with sulfuric acid to produce phosphoric acid, the building block of Nitrogen-Phosphorus-Potassium (N-P-K) agricultural fertilizers. Sulfuric acid was made at the Site and stored in lead-lined chambers. Environmental impacts typically associated with phosphate-based fertilizer manufacturing facilities include acidic pH conditions and elevated concentrations of metals, including lead and arsenic in soil, groundwater, sediment, and surface water.

A review of the available Sanborn Fire Insurance maps confirmed that the former VCC Winston-Salem plant was a complete factory with acid production facilities throughout its entire operational history. At various times throughout the plant's history, its features included an acid chamber structure, compressor room, pyrite burners, a pyrite house, acid towers, a nitre house, a boiler room, a pump house, various water towers, a 100,000-gallon reservoir, a tobacco stem and grinding warehouse and associated drying furnace, a transformer house, rock sheds, a mill building (for grinding, mixing, storage, and bagging of fertilizer), a bag house, a motor printing press, several storage/warehouses, scales, a corn crib, and an office.

Virginia Carolina Chemical (VCC) Company acquired the plant from Southern Chemical Company in 1902, and owned the Site until declaring bankruptcy in 1924. In 1926, Virginia Carolina Chemical Corporation emerged as a new company from the bankruptcy and took ownership of the Site. VCC Virginia Carolina Chemical Corporation merged into Socony Mobil Oil Company, Inc., in 1963, and the company name changed to Mobil Oil Corp. in 1966. In 1999, Exxon Corporation merged with Mobil Corporation to form Exxon Mobil Corporation. Mobil Oil became ExxonMobil Oil Corporation, the corporate successor to Virginia Carolina Chemical Corporation, and subsidiary to Exxon Mobil Corporation. is the parent present company of ExxonMobil Oil Corporation.

1. Removal Site Evaluation

Several investigations have been conducted at the Site. In 2005, the North Carolina Department of Environment and Natural Resources (NCDENR) and Environmental Investigations, Inc. (EI), on behalf of the North Carolina Department of Transportation (NCDOT), collected soil samples from 29 locations from the ground surface to a maximum depth of 20 feet below the ground surface. Arsenic was detected in 7 seven soil samples at concentrations exceeding the NCDENR Soil Remediation Goals (SRG) screening level of 22 mg/kg. Lead was detected in 11 soil samples at concentrations exceeding the NCDENR SRG screening level of 270 mg/kg. The SRG screening levels of 22 mg/kg for arsenic and 270 mg/kg for lead are NCDENR-determined levels Site-specific Action Levels (SSALs) documented in an email communication dated December 14, 2009, from Mr. David Mattison (NCDENR) to Mr. Matthew Pelton (ARCADIS).

In November 2008, ARCADIS, on behalf of ExxonMobil Environmental Services (EMES), and in coordination with NCDOT, collected soil samples from the Site as described in the *VCC Winston-Salem Site: Soil Screening and Sampling Event Summary Report* (ARCADIS, 2009). A total of 38 soil samples were collected and analyzed to determine the extent of arsenic and lead concentrations in the soil that potentially lie within or adjacent to the Site boundaries and beneath US Hwy 52/SR-8. Arsenic was detected in one sample collected from a depth of 38.5 to 40 feet below the surface beneath US Hwy 52/SR-8 at a concentration of 121 mg/kg, which exceeds the NCDENR SRGscreening-level of 27 mg/kg. Lead was detected in one soil sample collected from a depth of 3 to 5 feet beneath US Hwy 52/SR-8 at a concentration of 278 mg/kg, which exceeds the NCDENR SRGscreening-level of 270 mg/kg.

In March 2009, Hart & Hickman (H&H), on behalf of NCDOT, collected a total of 35 soil samples within the proposed NCDOT right-of-way along US Hwy 52/SR-8. Arsenic was detected in 4 soil samples from 3 boring locations at concentrations exceeding the NCDENR SRGscreening-level of 22 mg/kg. Lead was detected in 5 soil samples from 4 boring locations at concentrations exceeding the NCDENR SRGscreening-level of 270 mg/kg.

In May 2009, ARCADIS, on behalf of EMES, conducted a Removal Site Evaluation (RSE) at the Site. A total of 71 soil samples were collected and analyzed from 24 soil boring locations during the RSE. Arsenic was detected in 12 soil samples from 9 soil boring locations at concentrations exceeding the NCDENR SRGscreening-level of 22 mg/kg. Lead was detected in 10 soil samples from 6 soil boring locations at concentrations exceeding the NCDENR SRGscreening-level of 270 mg/kg. The maximum arsenic and lead concentrations detected in soil samples collected north of Hwy 52/SR-8 were 364 mg/kg and 20,100 mg/kg, respectively. The maximum arsenic and lead concentrations detected in soil samples collected during the RSE south of Hwy 52/SR-8 were 238 mg/kg and 4,380 mg/kg, respectively.

Based on the analytical results from the May 2009 investigation, additional delineation activities were conducted by ARCADIS, on behalf of EMES, in October and November 2009. These activities included the collection of an additional 142 soil samples from 48 soil boring locations, the installation of five groundwater monitoring wells, and the collection of groundwater samples from four of the wells. Toxicity Characteristic Leaching Procedure (TCLP) arsenic and lead analyses were also performed on 23 soil samples collected and composited from 25 soil boring locations where arsenic and/or lead concentrations exceeded the USEPA screening levels. In addition, two of the composite waste characterization samples were analyzed for TCLP metals, TCLP volatile organic compounds (VOCs), TCLP benzene, toluene, ethylbenzene, and xylene (BTEX), TCLP semi-volatile organic compounds (SVOCs), and polychlorinated biphenyls (PCBs). These analyses were performed to provide data to determine appropriate soil disposal requirements when evaluating potential soil removal response actions.

Arsenic and lead were detected in 69 many of the soil samples collected from the Site at concentrations which exceed the NCDENR SRGs of SSALs of 272 mg/kg and 270 mg/kg, respectively. The majority of the elevated arsenic and lead concentrations in soil was detected in the northeastern and eastern portions of the Site.

2. Physical Location

The Site is located in Winston-Salem, Forsyth County, North Carolina (Figure 1-1). The Site is in an old industrial area located northeast of downtown Winston-Salem.

The Site is bounded to the north by Norfolk Southern's rail yard and the Atlantic Scrap facility, to the east by the Norfolk Southern Railroad (and north Liberty Street beyond), to the south by vacant industrial land (and Indiana Avenue beyond), to the southwest by the Norfolk Southern railroad (and NCDOT Site No. 54 beyond), and to the west by a rolling storage yard owned by Waste Management of the Carolinas, Inc.. The Site is bisected from northwest to southeast by US Hwy 52/SR-8. The approximate geographical center of the Site is 36.1270° North Latitude and 80.2342° West Longitude.

Currently, the Site is occupied by two tax parcel-maps. Current property boundary information was obtained from the 2007 Forsyth County tax map.

3. Site Characteristics

The Site lies within the upstate region of North Carolina along the US Hwy 52/SR-8 corridor. The Site lies within the Piedmont Physiographic Province of North Carolina, which is characterized by generally rolling and well-rounded hills and ridges. Elevations at the Site vary range from approximately 937 to 970 feet above mean sea level. The Site is underlain by gneiss and schist of the Charlotte Belt, which consists of fine-grained biotite-quartz-feldspar gneiss and some inter-layered augen gneiss. Amphibolite layers occur locally and intrusive dikes of pegmatite and granite are also present.

The majority of the Site is heavily-vegetated. Portions of the Site that are not vegetated are covered by asphalt and gravel roads, parking areas, and railroad corridors. Surface water runoff generally flows to the northeast towards the Bowen Branch of Brushy Fork Creek located approximately 700 feet north of the Site. Bowen Branch flows easterly and discharges to Brushy Fork, and in turn, Brushy Fork discharges to Salem Creek on the east site of Winston-Salem. Salem Creek flows westerly through downtown Winston-Salem and discharges to the Yadkin River. On a regional scale, the Site is located within the Yadkin-Pee Dee River Basin.

4. Release or Threatened Release into the Environment of a Hazardous Substance, or Pollutant or Contaminant

The RSE, conducted in May 2009, and subsequent delineation sampling activities conducted in October and November of 2009, are the most recent sampling investigations conducted at the Site. The following is a brief bullet summary of these activities-RSE:

- A total of ~~2137~~ soil samples were collected and analyzed from ~~72~~ soil boring locations;
- Arsenic was detected in ~~361~~ soil samples from ~~249~~ soil boring location samples at concentrations exceeding the NCDENR SRGSSAL of 22 mg/kg;
- Lead was detected in ~~331~~ soil samples from ~~226~~ soil boring locations at concentrations exceeding the NCDENR SRGSSAL of 270 mg/kg;
- The maximum arsenic and lead concentrations detected in soil samples collected north of US Hwy 52/SR-8 were 364 mg/kg and 20,100 mg/kg, respectively;
- The maximum arsenic and lead concentrations detected in soil samples collected south of US Hwy 52/SR-8 were 238 mg/kg and 4,380 mg/kg, respectively;
- Twenty-one soil samples were analyzed for TCLP arsenic and lead; none of the samples contained detectable concentrations of arsenic; six (6) samples contained TCLP lead at concentrations above the standard of 5.0 mg/L; and
- Groundwater samples were collected from 4 groundwater monitoring wells; arsenic was not detected in any of the groundwater samples; lead was detected in one well at a concentration exceeding the North Carolina 2L Drinking Water Standard.

Formatted: Not Highlight
 Formatted: Not Highlight
 Formatted: Highlight

The USEPA screening levels for this site for arsenic and lead are 27 milligrams per kilogram (mg/kg), or parts-per-million, and 895 mg/kg, respectively. The NCDENR SRGs for this site Site-specific Action-levels (SSALs) established for soil contamination (documented by email communication dated December 14, 2009, from Mr. David Mattison (NCDENR) to Mr. Matthew Pelton (ARCADIS)) for arsenic and lead, are 22 milligrams per kilogram (mg/kg), or parts-per-million, and 270 mg/kg, respectively. The arsenic value of 22 mg/kg in soil is considered by NCDENR to be protective of human health based on potential exposure resulting from dermal contact, inhalation, and/or ingestion. The lead valueSSAL of 270 mg/kg for lead in soil is considered by NCDENR to be both protective of human health based on potential exposure resulting from dermal contact, inhalation, and/or ingestion, and protective of groundwater.

The Time-Critical Removal Action will address the Site-related contamination prior to the NCDOT's highway expansion project along US 52/SR-8, scheduled for summer 2010. ExxonMobil's strategy at this site is facilitate NCDOT's project and remove any regulatory uncertainty with implementation and long-term viability. ExxonMobil therefore, intends to meet USEPA requirements by removing soils with arsenic and lead above the USEPA screening levels. ExxonMobil also intends to meet the NCDENR requirements by removing soils with arsenic and lead above the NCDENR SRGs. The more conservative NCDENR SRGs will therefore be used as the Site-Specific Action Levels (SSALs) at the site.

Formatted: Indent: First line: 0"

5. National Priorities List (NPL) Status

As part of the Phosphate Fertilizer Initiative, ExxonMobil is voluntarily working with EPA and the State to address contamination at the Site. This Site is not on the NPL, but EPA considers this Site to be NPL-equivalent. A ranking package could be prepared in the future, and the Site could be proposed to the NPL, if needed.

6. Maps, Pictures, and Graphic Representations

Figures 1-1, 4-1A, and 4-1B from the SDR/RAWP are attached to this Action memo. Figure 1-1 is a Site location map, while 4-1A and 4-1B show the areas to be addressed during the Removal Action.

B. Other Actions To Date

1. Previous Actions

There have been no known actions taken at the Site to investigate the presence of Site-related contamination, or mitigate conditions, other than the investigations described in section II (A) (1) of this document.

2. Current Actions

Before the Removal Action begins at the Site, EPA and ExxonMobil will finalize an Administrative Settlement Agreement and Order on Consent for Removal Action (AOC) which will provide for implementation of the Removal Action at the Site, as well as continued investigations of the Site (if needed).

C. State and Local Authorities' Role

1. State and local Actions to Date

EPA and NCDENR have provided oversight during the Site Delineation and Removal Site Evaluation, and will continue to work together to coordinate oversight responsibilities during the Removal Action.

EPA will communicate with local officials throughout the Removal process. The local officials will be notified about the 30-day comment period to be held in February and March 2010, prior to start of the Removal Action in March 2010. [Note to Ken, is public comment period required under the TCRA?]

Formatted: Highlight

III. THREATS TO PUBLIC HEALTH OR WELFARE OR THE ENVIRONMENT AND STATUTORY AND REGULATORY AUTHORITIES

According to the criteria listed in Section 300.415 of the National Contingency Plan (NCP), the Site meets the requirements for initiating a Time-Critical Removal Action. Specifically, these include the following determinations:

A. Threats to Public Health or Welfare

Section 300.415(b)(2)(iv) - "soil with high levels of hazardous substances or pollutants or contaminants in soils largely at or near the surface, that may migrate". EPA has determined the following conditions exist at the Site which meet the requirements for initiating a Time-Critical Removal Action. Arsenic levels as high as 364 mg/kg or parts-per-million (ppm) exist in surface and subsurface soil; lead levels as high as 20,100 ppm exist in surface and subsurface soil. These levels of arsenic and lead in soil exceed the USEPA screening levels ~~NCDENR-approved SSALs~~, or cleanup criteria, for protection of human health through direct contact exposure and/or protection of groundwater (i.e., 227 mg/kg arsenic, 895270 mg/kg lead).

IV. ENDANGERMENT DETERMINATION

Actual or threatened releases of hazardous substances from this Site, if not addressed by implementing the response action selected in this Action Memorandum, may present an imminent and substantial endangerment to public health, or welfare, or the environment.

V. PROPOSED ACTIONS AND ESTIMATED COSTS

A. Proposed Actions

Due to the inherent uncertainties associated with the removal options evaluated for use at the Site, the On-Scene Coordinator, and EPA's designated Project Manager, in a manner consistent with the National Oil and Hazardous Substances Pollution

Contingency Plan (NCP), remain obligated to modify removal procedures as conditions warrant.

1. Description of Proposed Response Actions

An estimated 18,504,397 cubic yards of Site-related soil contamination and debris (e.g., concrete, brick, railroad ties, etc.) exceeding NCDENR's site SSALs will be excavated to meet the requirements of both USEPA and NCDENR for the soil removal at the site. Construction debris over one cubic yard in size will be left in place, or will be cleaned and left on-Site. Actual excavation limits will be determined in the field based on the confirmation sampling program. The soil removal areas encompass a total area of approximately 3.67 acres, and range in depth from 1 to 7 feet below land surface. ExxonMobil will treat and/or dispose of the contaminated soils and debris according to appropriate industry and regulatory standards.

Soils with TCLP arsenic and/or lead concentrations greater than or equal to 5.0 mg/l will either be stabilized and transported to a RCRA Subtitle D landfill for disposal, or transported to a RCRA Subtitle C landfill without being stabilized. Stabilization will be achieved via mixing of a phosphate-based stabilization agent with the soil in batches of approximately 200 tons so that efficient and uniform blending can be achieved.

If required by EPA and/or NCDENR, Institutional Controls (i.e., a restrictive covenant) will be applied to the Site property to ensure the long-term protection of human health and the environment at the Site, as well as to ensure the integrity of the Time-Critical Removal Action is not jeopardized by future construction and/or redevelopment activities at the Site.

ExxonMobil will restore areas which are disturbed by the Removal Action to their pre-removal state to the maximum extent practicable. Areas that overlap with the NCDOT's highway expansion project along US 52/SR-8, scheduled for summer 2010, will be restored consistent with NCDOT's project objectives.

The need for additional groundwater monitoring at the Site will be determined once the Soil Removal Action is complete.

The preferred response action to address soil contamination is selected for use at the Site for the following reasons:

- A. The preferred response action is considered technically feasible because it has been successfully implemented at other sites, and the materials and qualified commercial contractors are readily available;
- B. The preferred response action offers a balance between effectiveness and cost, (i.e., it will achieve the removal action objectives at a lower cost than other response actions evaluated for potential use; and

- C. EPA and NCDENR concur on the use of the preferred response action to address soil contamination at the Site.

2. Contribution to Remedial Performance

The proposed Time-Critical Removal Action will address the potential threats discussed in Section III, which meet the removal criteria established in Section 300.415(b)(2) of the NCP. Although future action under the EPA's Remedial program is unlikely, the Removal Action contemplated in this Action Memorandum is considered to be consistent with any future Remedial Action.

3. Engineering Evaluation/Cost Analysis (EE/CA)

This proposed action is a Time-Critical Removal Action and does not require an EE/CA.

4. Pre-Design Investigations/Removal Site Evaluation

Pre-Design investigations, including the Removal Site Evaluation (RSE) were conducted at the Site. The Final SDR/RAWP report, dated ~~February~~ January 2010, is attached to this Action Memorandum.

5. Applicable or Relevant and Appropriate Requirements (ARARS)

The Time-Critical Removal Action will be conducted in compliance with all Federal and State applicable or relevant and appropriate chemical-, action-, and location-, specific requirements (ARARS).

6. Project Schedule

The design document for the Time-Critical Removal Action, referred to the SDR/RAWP, has been finalized. The Time-Critical Removal Action is scheduled to begin at the Site in March 2010.

VI EXPECTED CHANGE IN THE SITUATION SHOULD ACTION BE DELAYED OR NOT TAKEN

If the Removal Action is significantly delayed or not taken at the Site, the potential threats explained in Section III of this Action Memorandum will continue to exist.

VII. OUTSTANDING POLICY ISSUES

EPA has chosen to address the contamination at the Site using EPA's Removal authority. EPA has extensive experience using Removal authority to investigate and implement removal actions to address contamination at former phosphate fertilizer plant

sites located in Region 4. The conventional removal techniques used to address the contamination at these sites are fundamentally the same, allowing for the use of "presumptive" remedies.

Contamination at the Site consists of lead and arsenic in the surface and subsurface soil, and conventional removal techniques will be utilized during the Removal Action to address the soil contamination.

Slightly-acidic pH conditions in the groundwater at the Site may have resulted in the mobilization of metals where they are present in the subsurface soil; however, only one groundwater monitoring well at the Site has contained a lead concentration above the North Carolina 2L drinking water standard. None of the groundwater samples have contained arsenic at concentrations above the North Carolina 2L drinking water standard.

Formatted: Not Highlight

A determination has not been made by EPA and/or NCDENR on the need for Institutional Controls (ICs) at the Site. However, if it is determined by EPA and/or NCDENR during the Removal Action that ICs are needed, ExxonMobil will be responsible for placing a restrictive covenant on the property deed for the Site. The ICs will help to ensure the integrity of the Time-Critical Removal Action is not compromised, thereby ensuring the long-term protection of human health and the environment. The ICs may include a restriction on the use of groundwater on those portions of the Site known to have Site-related groundwater contamination. The ICs will remain on the property deed until such time that EPA and/or NCDENR determine the ICs are not needed to protect human health and the environment.

VIII. ENFORCEMENT

As the corporate successor to the Virginia-Carolina Chemical Company (VCC) Corporation, ~~ExxonMobil~~ ExxonMobil Oil Corporation has been identified as the potentially responsible party (PRP) for the Site. EPA and ExxonMobil, parent to ExxonMobil Oil Corporation, are currently negotiating the terms of the AOC for conducting the Removal Action. EPA expects ExxonMobil will sign the AOC, thereby agreeing to fund and conduct the Time-Critical Removal Action.

IX. RECOMMENDATIONS

This decision document sets forth the selected Time-Critical Removal Action for the former Virginia-Carolina Chemical Company (VCC) Winston-Salem Site ("the Site"), located in Winston-Salem, Forsyth County, North Carolina. This Action Memorandum has been developed in accordance with CERCLA, as amended, and is consistent with the NCP. The selection of the preferred response actions is based on the Administrative Record for the Site. As required, EPA will hold a 30-day comment period [Note to Ken, is public comment period required under a TCRA?] to solicit public input on the selection of the preferred response actions prior to the start of the Removal Action.

Formatted: Highlight
Formatted: Highlight
Formatted: Highlight
Formatted: Highlight

The 30-day comment period is scheduled to begin on February 10, 2010, and end on March 12, 2010, prior to the start of the Removal Action.

Conditions at the Site meet the NCP section 300.415 (b) (2) criteria for a Time-Critical Removal Action. In addition, the Time-Critical Removal Action will address the Site-related contamination prior to the NCDOT's highway expansion project along US 52/SR-8, scheduled for summer 2010.

I recommend your approval of the proposed Time-Critical Removal Action.

Site Location & History

The former Virginia Carolina Chemical Company Site ("the Site") is located in an old industrial area located northeast of downtown Winston-Salem, Forsyth County, North Carolina (see Figure 1-1). The Site is bounded to the north by Norfolk Southern's rail yard and the Atlantic Scrap facility, to the east by the Norfolk Southern Railroad (and north Liberty Street beyond), to the south by vacant industrial land (and Indiana Avenue beyond), to the southwest by the Norfolk Southern railroad, and to the west by a rolling storage yard owned by Waste Management of the Carolinas, Inc. The Site is bisected from northwest to southeast by US Hwy 52/SR-8.

A former phosphate fertilizer plant was constructed at the Site by Southern Chemical Company between 1895 and 1900. Virginia Carolina Chemical Company (VCC) acquired the plant from Southern Chemical Company in 1902. The plant was continuously operated through 1927. In 1963, VCC merged into Socony Mobil Oil Company, Inc. The company name changed to Mobil Oil Corporation in 1966. In 1999, Exxon Corporation merged with Mobil Corporation to form Exxon Mobil Corporation. Mobil Oil became ExxonMobil Oil Corporation, the corporate successor to VCC, a subsidiary to Exxon Mobil Corporation.

Removal Site Evaluation

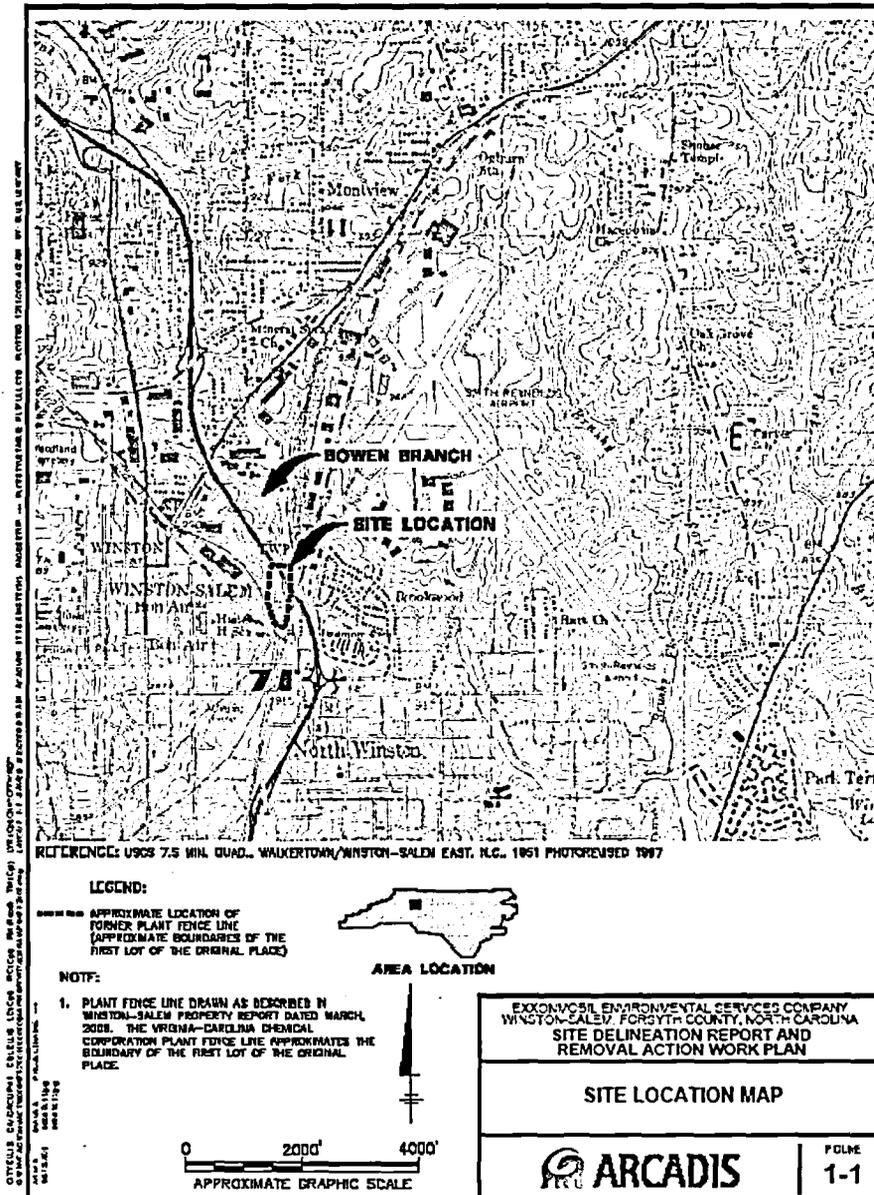

The facility produced phosphate fertilizers using lead-lined acid chambers. The process resulted in residual lead and arsenic in soil at the Site. Several investigations have been conducted at the Site which indicate elevated levels of arsenic and lead in soil which exceed the EPA Region 4 Removal Action Levels.

Planned Activities

Beginning in March 2010, ExxonMobil will perform a Removal Action which will involve excavating and removing an estimated 18,504 cubic yards of contaminated soil and debris from the Site. ExxonMobil will treat and dispose of the contaminated soil and debris at an approved, off-site landfill, following appropriate industry and regulatory standards. The soil removal areas encompass a total area of approximately 3.7 acres, and range in depth from 1 to 7 feet below land surface.

EPA and the North Carolina Department of Environment and Natural Resources (NCDENR) will provide oversight during the Removal Action.

ExxonMobil will restore the areas disturbed by the Removal Action to their pre-removal state to the maximum extent practicable. Areas that overlap with the North Carolina Department of Transportation's (NCDOT) highway expansion project along Highway 52/SR-8, scheduled for summer 2010, will be restored consistent with NCDOT's project objectives.

Winston-Salem, North Carolina 27101

Dear Mr. Evans:

The purpose of this letter is to inform you that the Environmental Protection Agency - Region 4 ("EPA") and the North Carolina Department of Environment and Natural Resources ("NCDENR") have the regulatory authority to oversee the soil removal work to be performed by ExxonMobil Environmental Services Company ("EMES") to address the contamination related to the former Virginia Carolina Chemical Company (VCC) Winston-Salem property (the "Site") located in Winston-Salem, North Carolina.

You can contact me at (404) 562-8802, or by email at mallary.ken@epa.gov, if you have any questions regarding this matter.

Sincerely,

A handwritten signature in cursive script that reads "McKenzie Mallary".

ENFORCEMENT ACTION MEMORANDUM

Subject: Request for a Time-Critical Removal Action at the Virginia Carolina Chemical Corporation Site, Winston-Salem, Forsyth County, North Carolina

From: Tim Neal, On-Scene Coordinator
Emergency Response and Removal Branch

McKenzie Mallary, Remedial Project Manager
Superfund Remedial and Site Evaluation Branch

Thru: Shane Hitchcock, Chief
Emergency Response and Removal Branch

To: Franklin E. Hill, Director
Superfund Division

I. Purpose

The purpose of this Action Memorandum, pursuant to Section 104 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), is to request and document approval of the proposed enforcement-lead Time-Critical Removal Action described herein for the Virginia-Carolina Chemical (VCC) Site ("the Site"), located in Winston-Salem, Forsyth County, North Carolina. The Site poses a potential threat to public health and the environment that meets the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) Section 300-415(b) (2) criteria for a Time-Critical Removal Action. ExxonMobil Corporation is the corporate successor to VCC. This Removal Action will be enforcement-lead pursuant to an Administrative Order on Consent (AOC) with ExxonMobil.

II. SITE CONDITIONS AND BACKGROUND

A. Site Description

Site ID#: A4YD

Type: Time Critical Removal Action

The Site is the location of a former phosphate fertilizer plant in Winston-Salem, North Carolina. The plant was constructed by Southern Chemical Company between 1895 and 1900, and was continuously operated through 1927.

Phosphate fertilizer manufacturing at the Site generally involved reacting phosphate ores with sulfuric acid to produce phosphoric acid, the building block of Nitrogen-Phosphorus-Potassium (N-P-K) agricultural fertilizers. Sulfuric acid was made at the Site and stored in lead-lined chambers. Environmental impacts typically associated with phosphate-based fertilizer manufacturing facilities include acidic pH conditions and elevated concentrations of metals, including lead and arsenic in soil, groundwater, sediment, and surface water.

A review of the available Sanborn Fire Insurance maps confirmed that the former VCC Winston-Salem plant was a complete factory with acid production facilities throughout its entire operational history. At various times throughout the plant's history, its features included an acid chamber structure, compressor room, pyrite burners, a pyrite house, acid towers, a nitre house, a boiler room, a pump house, various water towers, a 100,000-gallon reservoir, a tobacco stem and grinding warehouse and associated drying furnace, a transformer house, rock sheds, a mill building (for grinding, mixing, storage, and bagging of fertilizer), a bag house, a motor printing press, several storage/warehouses, scales, a corn crib, and an office.

Virginia-Carolina Chemical (VCC) Company acquired the plant from Southern Chemical Company in 1902. VCC merged into Socony Mobil Oil Company, Inc., in 1963, and the company name changed to Mobil Oil Corp. in 1966. In 1999, Exxon Corporation merged with Mobil Corporation to form Exxon Mobil Corporation. Mobil Oil became ExxonMobil Oil Corporation, the corporate successor to VCC. Exxon Mobil Corporation is the present company of ExxonMobil Oil Corporation.

1. Removal Site Evaluation

Several investigations have been conducted at the Site. In 2005, the North Carolina Department of Environment and Natural Resources (NCDENR) and Environmental Investigations, Inc. (EI), on behalf of the North Carolina Department of Transportation (NCDOT), collected soil samples from 29 locations from the ground surface to a maximum depth of 20 feet below the ground surface. Arsenic was detected in 7 seven soil samples at concentrations exceeding the screening level of 22 mg/kg. Lead was detected in 11 soil samples at concentrations exceeding the screening level of 270 mg/kg. The screening levels of 22 mg/kg for arsenic and 270 mg/kg for lead are NCDENR-determined Site-specific Action Levels (SSALs) documented in an email communication dated December 14, 2009, from Mr. David Mattison (NCDENR) to Mr. Matt Pelton (ARCADIS).

In November 2008, ARCADIS, on behalf of ExxonMobil Environmental Services (EMES), and in coordination with NCDOT, collected soil samples from the Site as described in the *VCC Winston-Salem Site: Soil Screening and Sampling Event Summary Report* (ARCADIS, 2009). A total of 38 soil samples were collected and analyzed to determine the extent of arsenic and lead concentrations in the soil that potentially lie within or adjacent to the Site boundaries and beneath US Hwy 52/SR-8. Arsenic was detected in one sample collected from a depth of 38.5 to 40 feet below the surface

beneath US Hwy 52/SR-8 at a concentration of 121 mg/kg, which exceeds the screening level of 27 mg/kg. Lead was detected in one soil sample collected from a depth of 3 to 5 feet beneath US Hwy 52/SR-8 at a concentration of 278 mg/kg, which exceeds the screening level of 270 mg/kg.

In March 2009, Hart & Hickman (H&H), on behalf of NCDOT, collected a total of 35 soil samples within the proposed NCDOT right-of-way along US Hwy 52/SR-8. Arsenic was detected in 4 soil samples from 3 boring locations at concentrations exceeding the screening level of 22 mg/kg. Lead was detected in 5 soil samples from 4 boring locations at concentrations exceeding the screening level of 270 mg/kg.

In May 2009, ARCADIS, on behalf of EMES, conducted a Removal Site Evaluation (RSE) at the Site. A total of 71 soil samples were collected and analyzed from 24 soil boring locations during the RSE. Arsenic was detected in 12 soil samples from 9 soil samples at concentrations exceeding the screening level of 22 mg/kg. Lead was detected in 10 soil samples from 6 soil boring locations at concentrations exceeding the screening level of 270 mg/kg. The maximum arsenic and lead concentrations detected in soil samples collected north of Hwy 52/SR-8 were 364 mg/kg and 20,100 mg/kg, respectively. The maximum arsenic and lead concentrations detected in soil samples collected south of Hwy 52/SR-8 were 238 mg/kg and 4,380 mg/kg, respectively.

Based on the analytical results from the May 2009 investigation, additional delineation activities were conducted by ARCADIS, on behalf of EMES, in October and November 2009. These activities included the collection of soil samples, the installation of five groundwater monitoring wells, and the collection of groundwater samples from four of the wells. Toxicity Characteristic Leaching Procedure (TCLP) arsenic and lead analyses were also performed on 23 soil samples collected and composited from 25 soil boring locations where arsenic and/or lead concentrations exceeded the USEPA screening levels. In addition, two of the composite waste characterization samples were analyzed for TCLP metals, TCLP volatile organic compounds (VOCs), TCLP benzene, toluene, ethylbenzene, and xylene (BTEX), TCLP semi-volatile organic compounds (SVOCs), and polychlorinated biphenyls (PCBs). These analyses were performed to provide data to determine appropriate soil disposal requirements when evaluating potential soil removal response actions.

Arsenic and lead were detected in many of the soil samples collected from the Site at concentrations which exceed the SSALs of 27 mg/kg and 270 mg/kg, respectively. The majority of the elevated arsenic and lead concentrations in soil was detected in the northeastern and eastern portions of the Site.

2. Physical Location

The Site is located in Winston-Salem, Forsyth County, North Carolina (Figure 1-1). The Site is in an old industrial area located northeast of downtown Winston-Salem.

The Site is bounded to the north by Norfolk Southern's rail yard and an Atlantic Scrap facility, to the east by the Norfolk Southern Railroad (and north Liberty Street beyond), to the south by vacant industrial land (and Indiana Avenue beyond), to the southwest by the Norfolk Southern railroad (and NCDOT Site No. 54 beyond), and to the west by a rolling storage yard owned by Waste management. The Site is bisected from northwest to southeast by US Hwy 52/SR-8. The approximate geographical center of the Site is 36.1270° North Latitude and 80.2342° West Longitude.

Currently, the Site is occupied by two tax parcel maps. Current property boundary information was obtained from the 2007 Forsyth County tax map.

3. Site Characteristics

The Site lies within the upstate region of North Carolina along the US Hwy 52/SR-8 corridor. The Site lies within the Piedmont Physiographic province of North Carolina, which is characterized by generally rolling and well-rounded hills and ridges. Elevations at the Site range from 937 to 970 feet above mean sea level. The Site is underlain by gneiss and schist of the Charlotte Belt, which consists of fine-grained biotite-quartz-feldspar gneiss and some inter-layered augen gneiss. Amphibolite layers occur locally and intrusive dikes of pegmatite and granite are also present.

The majority of the Site is heavily-vegetated. Portions of the Site that are not vegetated are covered by asphalt and gravel roads, parking areas, and railroad corridors. Surface water runoff generally flows to the northeast towards the Bowen Branch of Brushy Fork Creek located approximately 700 feet north of the Site. Bowen Branch flows easterly and discharges to Brushy Fork, and in turn, Brushy Fork discharges to Salem Creek on the east site of Winston-Salem. Salem Creek flows westerly through downtown Winston-Salem and discharges to the Yadkin River. On a regional scale, the Site is located within the Yadkin-Pee Dee River Basin.

4. Release or Threatened Release into the Environment of a Hazardous Substance, or Pollutant or Contaminant

The RSE, conducted in May 2009, is the most recent sampling investigations conducted at the Site. The following is a brief bullet summary of the RSE:

- A total of 71 soil samples were collected and analyzed from 24 soil boring locations;
- Arsenic was detected in 12 soil samples from 9 soil samples at concentrations exceeding the SSAL of 22 mg/kg;
- Lead was detected in 10 soil samples from 6 soil boring locations at concentrations exceeding the SSAL of 270 mg/kg;

- The maximum arsenic and lead concentrations detected in soil samples collected north of US Hwy 52/SR-8 were 364 mg/kg and 20,100 mg/kg, respectively;
- The maximum arsenic and lead concentrations detected in soil samples collected south of US Hwy 52/SR-8 were 238 mg/kg and 4,380 mg/kg, respectively;
- Twenty-one soil samples were analyzed for TCLP arsenic and lead; none of the samples contained detectable concentrations of arsenic; six (6) samples contained TCLP lead at concentrations above the standard of 5.0 mg/L; and
- Groundwater samples were collected from 4 groundwater monitoring wells; arsenic was not detected in any of the groundwater samples; lead was detected in one well at a concentration exceeding the North Carolina 2L Drinking Water Standard.

The Site-specific Action levels (SSALs) established for soil contamination (documented by email communication dated December 14, 2009, from Mr. David Mattison (NCDENR) to Mr. Matthew Pelton (ARCADIS) for arsenic and lead, are 22 milligrams per kilogram (mg/kg), or parts-per-million, and 270 mg/kg, respectively. The arsenic value of 22 mg/kg in soil is considered by NCDENR to be protective of human health based on potential exposure resulting from dermal contact, inhalation, and/or ingestion. The SSAL of 270 mg/kg for lead in soil is considered by NCDENR to be both protective of human health based on potential exposure resulting from dermal contact, inhalation, and/or ingestion, and protective of groundwater.

5. National Priorities List (NPL) Status

As part of the Phosphate Fertilizer Initiative, ExxonMobil is voluntarily working with EPA and the State to address contamination at the Site. This Site is not on the NPL, but EPA considers this Site to be NPL-equivalent. A ranking package could be prepared in the future, and the Site could be proposed to the NPL, if needed.

6. Maps, Pictures, and Graphic Representations

Figures 1-1, 4-1A, and 4-1B from the SDR/RAWP are attached to this Action memo. Figure 1-1 is a Site location map, while 4-1A and 4-1B show the areas to be addressed during the Removal Action.

B. Other Actions To Date

1. Previous Actions

There have been no known actions taken at the Site to investigate the presence of Site-related contamination, or mitigate conditions, other than the investigations described in section II (A) (1) of this document.

2. Current Actions

Before the Removal Action begins at the Site, EPA and ExxonMobil will finalize an Administrative Order on Consent (AOC) which will provide for implementation of the Removal Action at the Site, as well as continued investigations of the Site (if needed).

C. State and Local Authorities' Role

1. State and local Actions to Date

EPA and NCDENR have provided oversight during the Site Delineation and Removal Site Evaluation, and will continue to work together to coordinate oversight responsibilities during the Removal Action.

EPA will communicate with local officials throughout the Removal process. The local officials will be notified about the 30-day comment period to be held in February and March 2010, prior to start of the Removal Action in March 2010.

III. THREATS TO PUBLIC HEALTH OR WELFARE OR THE ENVIRONMENT AND STATUTORY AND REGULATORY AUTHORITIES

According to the criteria listed in Section 300.415 of the National Contingency Plan (NCP), the Site meets the requirements for initiating a Time-Critical Removal Action. Specifically, these include the following determinations:

A. Threats to Public Health or Welfare

Section 300.415(b)(2)(iv) - "*soil with high levels of hazardous substances or pollutants or contaminants in soils largely at or near the surface, that may migrate*". EPA has determined the following conditions exist at the Site which meet the requirements for initiating a Time-Critical Removal Action. Arsenic levels as high as 364 mg/kg or parts-per-million (ppm) exist in surface and subsurface soil; lead levels as high as 20,100 ppm exist in surface and subsurface soil. These levels of arsenic and lead in soil exceed the NCDENR-approved SSALs, or cleanup criteria, for protection of human health through direct contact exposure and/or protection of groundwater (i.e., 22 mg/kg arsenic, 270 mg/kg lead).

IV. ENDANGERMENT DETERMINATION

Actual or threatened releases of hazardous substances from this Site, if not addressed by implementing the response action selected in this Action Memorandum, may present an imminent and substantial endangerment to public health, or welfare, or the environment.

V. PROPOSED ACTIONS AND ESTIMATED COSTS

A. Proposed Actions

Due to the inherent uncertainties associated with the removal options evaluated for use at the Site, the On-Scene Coordinator, and EPA's designated Project Manager, in a manner consistent with the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), remain obligated to modify removal procedures as conditions warrant.

1. Description of Proposed Response Actions

An estimated 18,397 cubic yards of Site-related soil contamination and debris (e.g., concrete, brick, railroad ties, etc.) exceeding NCDENR's SSALs will be excavated. Construction debris over one cubic yard in size will be left in place, or will be cleaned and left on-Site. Actual excavation limits will be determined in the field based on the confirmation sampling program. The soil removal areas encompass a total area of approximately 3.6 acres, and range in depth from 1 to 7 feet below land surface. ExxonMobil will treat and/or dispose of the contaminated soils and debris according to appropriate industry and regulatory standards.

Soils with TCLP arsenic and/or lead concentrations greater than or equal to 5.0 mg/l will either be stabilized and transported to a RCRA Subtitle D landfill for disposal, or transported to a RCRA Subtitle C landfill without being stabilized. Stabilization will be achieved via mixing of a phosphate-based stabilization agent with the soil in batches of approximately 200 tons so that efficient and uniform blending can be achieved.

If required by EPA and/or NCDENR, Institutional Controls (i.e., a restrictive covenant) will be applied to the Site property to ensure the long-term protection of human health and the environment at the Site, as well as to ensure the integrity of the Time-Critical Removal Action is not jeopardized by future construction and/or redevelopment activities at the Site.

ExxonMobil will restore areas which are disturbed by the Removal Action to their pre-removal state to the maximum extent practicable.

The need for additional groundwater monitoring at the Site will be determined once the soil Removal Action is complete.

The preferred response action to address soil contamination is selected for use at the Site for the following reasons:

- A. The preferred response action is considered technically feasible because it has been successfully implemented at other sites, and the materials and qualified commercial contractors are readily available;
- B. The preferred response action offers a balance between effectiveness and cost, (i.e., it will achieve the removal action objectives at a lower cost than other response actions evaluated for potential use; and
- C. EPA and NCDENR concur on the use of the preferred response action to address soil contamination at the Site.

2. Contribution to Remedial Performance

The proposed Time-Critical Removal Action will address the potential threats discussed in Section III, which meet the removal criteria established in Section 300.415(b)(2) of the NCP. Although future action under the EPA's Remedial program is unlikely, the Removal Action contemplated in this Action Memorandum is considered to be consistent with any future Remedial Action.

3. Engineering Evaluation/Cost Analysis (EE/CA)

This proposed action is a Time-Critical Removal Action and does not require an EE/CA.

4. Pre-Design Investigations/Removal Site Evaluation

Pre-Design investigations, including the Removal Site Evaluation (RSE) were conducted at the Site. The Final SDR/RAWP report, dated January 2010, is attached to this Action Memorandum.

5. Applicable or Relevant and Appropriate Requirements (ARARS)

The Time-Critical Removal Action will be conducted in compliance with all Federal and State applicable or relevant and appropriate chemical-, action-, and location-, specific requirements (ARARs).

6. Project Schedule

The design document for the Time-Critical Removal Action, referred to the SDR/RAWP, has been finalized. The Time-Critical Removal Action is scheduled to begin at the Site in March 2010.

VI EXPECTED CHANGE IN THE SITUATION SHOULD ACTION BE DELAYED OR NOT TAKEN

If the Removal Action is significantly delayed or not taken at the Site, the potential threats explained in Section III of this Action Memorandum will continue to exist.

VII. OUTSTANDING POLICY ISSUES

EPA has chosen to address the contamination at the Site using EPA's Removal authority. EPA has extensive experience using Removal authority to investigate and implement removal actions to address contamination at former phosphate fertilizer plant sites located in Region 4. The conventional removal techniques used to address the contamination at these sites are fundamentally the same, allowing for the use of "presumptive" remedies.

Contamination at the Site consists of lead and arsenic in the surface and subsurface soil, and conventional removal techniques will be utilized during the Removal Action to address the soil contamination.

Slightly-acidic pH conditions in the groundwater at the Site have resulted in the mobilization of metals where they are present in the subsurface soil; however, only one groundwater monitoring well at the Site has contained a lead concentration above the North Carolina 2L drinking water standard. None of the groundwater samples have contained arsenic at concentrations above the North Carolina 2L drinking water standard.

A determination has not been made by EPA and/or NCDENR on the need for Institutional Controls (ICs) at the Site. However, if it is determined by EPA and/or NCDENR during the Removal Action that ICs are needed, ExxonMobil will be responsible for placing a restrictive covenant on the property deed for the Site. The ICs will help to ensure the integrity of the Time-Critical Removal Action is not compromised, thereby ensuring the long-term protection of human health and the environment. The ICs may include a restriction on the use of groundwater on those portions of the Site known to have Site-related groundwater contamination. The ICs will remain on the property deed until such time that EPA and/or NCDENR determine the ICs are not needed to protect human health and the environment.

VIII. ENFORCEMENT

As the corporate successor to the Virginia-Carolina Chemical Company (VCC), ExxonMobil has been identified as the potentially responsible party (PRP) for the Site. EPA and ExxonMobil are currently negotiating the terms of the AOC for conducting the Removal Action. EPA expects ExxonMobil will sign the AOC, thereby agreeing to fund and conduct the Time-Critical Removal Action.

IX. RECOMMENDATIONS

This decision document sets forth the selected Time-Critical Removal Action for the Virginia-Carolina Chemical (VCC) Winston-Salem Site ("the Site"), located in Winston-Salem, Forsyth County, North Carolina. This Action Memorandum has been developed in accordance with CERCLA, as amended, and is consistent with the NCP. The selection of the preferred response actions is based on the Administrative Record for the Site. As required, EPA will hold a 30-day comment period to solicit public input on the selection of the preferred response actions prior to the start of the Removal Action. The 30-day comment period is scheduled to begin on February 10, 2010, and end on March 12, 2010, prior to the start of the Removal Action.

Conditions at the Site meet the NCP section 300.415 (b) (2) criteria for a Time-Critical Removal Action. In addition, the Time-Critical Removal Action will address the Site-related contamination prior to the NCDOT's highway expansion project along US 52/SR-8, scheduled for summer 2010.

I recommend your approval of the proposed Time-Critical Removal Action.

Subject: EPA Comments on Removal Action Work Plan
Former VCC Winston-Salem Site, Winston-Salem, North Carolina

Dear Mr. Schmidt:

I have reviewed the Draft Site Delineation Report/Removal Action Work Plan (SDR/RAWP) for the VCC Winston-Salem Site, located in Winston-Salem, North Carolina, and have the following comments. Please provide responses to EPA and NCDENR, revise the documents as appropriate, and provide revised copies of this report to EPA and NCDENR by February 5, 2010.

Please contact me at (404) 562-8802, or by email at mallary.ken@epa.gov, if you have any questions or comments regarding these comments.

Sincerely,

A handwritten signature in cursive script that reads "McKenzie Mallary".

McKenzie Mallary
Remedial Project Manager

Matthew Pelton, ARCADIS
Geoff Germann, ARCADIS

EPA General Comments

The sample designations provided in the text of the SDR/RAWP do not match the sample designations on the Figures. Please add language to the document, and in the legend of each figure, that explains the discrepancy in the sample designation.

EPA Specific Comments

Page 6, Section 1.3.2 - In the second paragraph, third sentence, the abbreviation "US-52/SR-8" is used twice. Please correct.

Page 16, Section 3.3.1, first paragraph – should sample WS-WS-53 be WS-SB-53?

Page 20, Section 4.1 – Eliminate the gap in the second sentence.

Page 21, Section 4.2 – In the second paragraph, the document states the excavation of soil will take place on 4 properties with total area of 4.6 acres, yet on page 20, the document states the soil removal areas encompass a total area of 3.6 acres. Please correct the discrepancy.

Page 22, Section 4.2.1- In the first full paragraph, the document states that the areas with samples containing greater than 5 mg/L TCLP lead will be addressed either by stabilizing the soil or transporting the soil off-site for disposal. However, Figure 4-1A shows sample locations C-2, C-8, and SB-12 as areas that will not be addressed during the Removal Action. If these areas will not be addressed during the Removal Action, please add language to the document explaining why. If these areas will be addressed during the Removal Action, please modify Figure 4-1A to indicate that these areas will be addressed.

Page 22, first sentence - in the event a demarcation liner is used during the removal action, I recommend that language be added to the IC document which describes in detail the location and depths of the liner.

Page 22, last paragraph - I recommend the groundwater investigation be completed at the Site, and a determination made regarding potential groundwater-use restrictions, before we generate an IC document for the Site.

Page 24, Section 5.1, 3rd paragraph – A Post-Removal Site Control Plan needs to be developed which identifies all post-removal monitoring for the Site. The Post-Removal Site Control Plan will be reviewed and approved by EPA and NCDENR before the EPA approves the Final Removal Action Report for the Site.

Figure 4-1A shows sample location "8-3" as a soil boring location (collected by Hart and Hickman in 2009) with arsenic and/or lead above screening levels, but the sample location is not included in an area to be addressed during the removal action. Please explain why this location will not be addressed during the Removal Action. If the sample location will be addressed during the Removal Action, please modify Figure 4-1A to indicate that it will be addressed.

ENVIRONMENTAL

Subject:
Removal Site Evaluation Work Plan
Former Virginia-Carolina Chemical Corporation Site
Durham, North Carolina

Date:
January 15, 2010

Dear Mr. Zeller:

Contact:
Kirstyn White, P.E.

This work plan presents Exxon Mobil Environmental Services Company's (ExxonMobil's) approach for conducting a Removal Site Evaluation (RSE) at the former Virginia-Carolina Chemical Corporation (VCC) fertilizer plant located in Durham, Durham County, North Carolina. The objective of this RSE Work Plan is to collect soil data for initial screening purposes to identify whether the site contains constituents related to historic activities associated with the VCC Durham operations.

Phone:
919.415.2261

Email:
Kirstyn.white@arcadis-us.com

Background

Our ref:
B0085794.0011

Virginia-Carolina Chemical Company purchased the Durham fertilizer plant in the 1890s and operated the plan until entering bankruptcy in 1924. At the conclusion of Virginia-Carolina Chemical Company's bankruptcy and reorganization proceedings in 1926, VCC of Richmond, Virginia emerged as a new company and continued to own the Durham fertilizer plant until 1970. VCC merged into Socony Mobil Oil Company, Inc. in 1963, and the company name changed in 1966 to Mobil Oil Corporation. Mobil Oil Corporation sold the Durham plant site in 1970 to Swift Agricultural Chemical Corporation. In 1999, Exxon Corporation merged with Mobil Corporation to form Exxon Mobil Corporation. Mobil Oil became ExxonMobil Oil Corporation, the corporate successor to VCC. Exxon Mobil Corporation is the parent company of ExxonMobil Oil Corporation.

The former VCC fertilizer plant was located in Durham, Durham County, North Carolina. Figure 1 depicts the location of the former Durham property on a portion of the United States Geological Survey (USGS) 7.5-minute quadrangle map for

Imagine the result

Southeast Durham, North Carolina. The current street address that most closely matches the former acid chamber location is 2700 Angier Avenue. The geographical location of the center of the Site is at 35.5840° North Latitude and 78.5219° West Longitude (North American Datum of 1983 [NAD83]).

Figure 2 depicts the approximate former boundaries of Durham Site superimposed on a 2007 aerial photograph. Figure 2 also depicts the approximate locations of historical site features digitized from Sanborn maps and aerial photographs. The Site is currently occupied by vacant lots and commercial and industrial facilities including Magnetic Attractions and Portable On Demand Storage (PODS). The Magnetic Attractions facility and adjacent parking lot are located on the central portion of the property along Angier Avenue and are fenced off from the road. The PODs warehouse and parking lot are located on the western portion of the site and are adjacent to the railroad tracks in the vicinity of the former fertilizer building and bag house. Most of the former VCC facility is currently paved as a parking lot or covered by the facility buildings.

The former Durham property can be accessed from Angier Avenue and the Norfolk Southern Railroad right-of-way (ROW). Railroad ROWs form the northern, southwestern, and part of the eastern boundaries of the former property. Vacant lots are adjacent to the former VCC Durham facility and are located at both the southeastern and eastern portions of the property. Drainage from the former facility flows southeast away from the site in a drainage ditch located within the vacant lot along Angier Avenue.

Surrounding land use of the former Durham property includes commercial and industrial facilities, residential properties, a church, and undeveloped land (Figure 2). The nearest residential properties are approximately 100 feet to the north across the Norfolk Southern Railroad right-of-way. Additionally, Hoover Road Apartments are located approximately 200 feet to the northeast of the intersection of the railroad and Angier Avenue. Thomas Concrete of the Carolinas Inc. is adjacent to the vacant lots along Angier Avenue.

Currently, the former Durham site is occupied by three tax parcels. Owner information is presented on Table 1. Property boundary and owner information was provided by the Durham County Public Records Database.

Operational History

Based on a review of available historical Sanborn maps, the VCC Durham facility became a complete plant, with an acid chamber structure, that produced phosphate fertilizers between 1907 and 1913. Fertilizer manufacturing continued at this site until sometime between 1950 and 1979. Sanborn maps also indicated that the site operated as a dry mixing plant for a short time around 1907.

Structures associated with the former plant included a fertilizer building (mixing and storage), one acid chamber structure and associated burners, railroad sidings, a nitre magazine, a motor room, a boiler room, a bag house, a 100,000-gallon reservoir, a locker house, and an office. VCC board meeting minutes indicate that in 1946 funds were allocated for the rehabilitation of the Durham acid plant. Figure 2 depicts the general locations of the former site features.

Proposed RSE Sampling Activities

This RSE Work Plan includes provisions for the collection and analysis of soil samples to confirm the presence or absence of potential operations-related constituents. Based on experience at other VCC sites, operations related constituents are arsenic and lead. In addition, the presence of low pH (i.e., less than 6.5 standard units) is a typical indicator of historical acid production processes conducted at former VCC sites. Therefore, samples collected at the Durham Site will be analyzed for arsenic, lead, and pH. The locations of all soil samples described below are tentative. Actual locations may be adjusted in the field depending on direct observations and site logistics/access limitations.

All samples will be collected in accordance with the United States Environmental Protection Agency (USEPA) Region 4 *Field Branches Quality System and Technical Procedures* [USEPA, Region 4, Science and Ecosystem Support Division (SESD), most current versions of applicable procedures will be followed]. The proposed sampling approach for the RSE is summarized below.

Soil Sampling Program

A total of 50 soil borings are proposed for the Durham Site. The soil sampling program was developed using USEPA's Judgmental Sampling methods described in *Guidance of Choosing a Sampling Design for Environmental Data Collection* (USEPA, 2002). Judgmental Sampling allows for the use of professional judgment in

order to bias sample locations towards areas of known historical use (e.g., acid chambers, sulfur storage areas). Soil borings in locations outside the former plant area were biased toward areas where there is the potential for human contact to soil. Figure 3 depicts the proposed soil boring locations. Additional soil borings may be advanced at the discretion of ExxonMobil or at the request of the USEPA. Prior to intrusive activities, ARCADIS will coordinate with local utility companies and a private subsurface utility locating service to identify and mark all subsurface utilities near the proposed boring locations. Boring locations may be adjusted in the field based on the presence of existing utilities or other access limitations.

Soil Screening and Analysis Procedures

Soil borings will be advanced at each location using a stainless steel hand auger from the ground surface to a maximum depth of 4 feet below ground surface (ft bgs), or until refusal or groundwater is encountered, whichever occurs first. Each boring interval (0 – 0.5, 0.5 – 2.0, and 2.0 – 4.0 ft bgs) will be screened for lead and arsenic in the field using a portable X-ray fluorescence (XRF) unit. Soil samples will be collected from each boring interval and submitted to TestAmerica Laboratories of Nashville, Tennessee for arsenic, lead, and pH analysis. A summary of the proposed soil sampling program is provided in Table 2.

Surface Water and Sediment Sampling Program

According to historical information, drainage from the former facility flows southeast away from the site in a drainage ditch located within the vacant lot along Angier Avenue. During the soil investigation, the presence of the drainage ditch will be confirmed. If surface water is present in the drainage ditch, surface water and sediment samples will be collected.

Surface water and sediment sampling, if required, will be conducted using the applicable procedures provided in the USEPA Region 4 *Field Branches Quality System and Technical Procedures*. Co-located surface water and sediment samples will be collected from locations identified in any major drainage pathways on the site. Surface water samples will be collected prior to sediment sampling in a downstream to-upstream direction. Surface water samples will be collected by directly filling the sample containers from as near as practical to the center of the waterbody. Following sample collection, water quality parameters will be monitored for pH, temperature, specific conductivity, DO, ORP, and turbidity at the depth from which the sample was collected using a water quality meter. Sediment samples will be collected from the

top 6 inches of the sediment using a stainless steel scoop. At each sediment sample location the total water depth and sediment characteristics will be noted. Any surface water/sediment samples that are collected will be submitted to TestAmerica Laboratories of Nashville, Tennessee for arsenic and lead analysis. Sediment samples will also be analyzed for pH by the laboratory. A summary of the tentative sediment and surface water sampling program is provided in Table 3.

Quality Assurance/Quality Control

All sample procedures will be performed in accordance with the methods identified in the USEPA Region 4 Field Branches Quality System and Technical Procedures. Sampling equipment will include both disposable and re-usable components. Disposable equipment that comes in contact with the soil will be contained in properly labeled 55-gallon United Nations (UN)-approved steel drums and disposed appropriately. Re-usable equipment will be decontaminated prior to, and in between use, in accordance with the decontamination procedures identified in the USEPA *Region 4 Field Branches Quality System and Technical Procedures*. All samples will be analyzed in accordance with USEPA SW-846 procedures with Contract Laboratory Program (CLP)-like data packages. Quality assurance/quality control (QA/QC) procedures will include the collection and analysis of blind field duplicates, equipment rinsate blanks, and matrix spike/matrix spike duplicate (MS/MSD) samples. The number and frequency of QA/QC samples are summarized in Tables 2 and 3.

Surveying

All proposed soil boring locations will be staked (or marked) in the field and documented using global positioning system (GPS) methods.

Investigation Derived Waste

All investigation derived waste (IDW) including soils, plastic, decontamination fluids, and personal protective equipment (PPE), will be containerized in properly labeled UN-approved 55-gallon steel drums. Laboratory analysis of each media (i.e., soil and water) will be performed by TestAmerica on a quick turn-around schedule to minimize the amount of time that the drums are staged on-site. Drums containing solids will be analyzed for toxicity characteristic leaching procedure (TCLP) metals and drums containing water will be analyzed for Target Analyte List (TAL) metals and

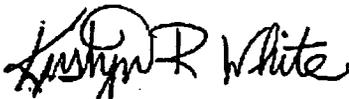

pH (Table 1). IDW disposal requirements will be based on the analytical results and IDW disposal will be performed at an ExxonMobil selected facility.

Property Access Agreements

ExxonMobil will obtain access agreements from the three property owners affected by the proposed RSE activities. Upon USEPA approval of this RSE Work Plan, and negotiation of the necessary access agreements, ExxonMobil will proceed with the implementation of this Work Plan for the Durham Site. Work activities could likely be initiated within 30 days of USEPA approval and obtaining access agreements.

Sincerely,

ARCADIS

Kirstyn R. White, P.E.

Sediment Samples						
Arsenic and Lead	4	1	1	0	6	1
pH	4	0	0	0	4	0
Surface Water Samples (Aqueous)						
Arsenic and Lead	4	1	0	0	5	1

Notes:

Surface water and sediment samples will be collected if observed to be present on site. Refer to text for further information.

Arsenic and lead will be analyzed via USEPA SW-846 6010C.

pH will be analyzed via SW-846 9045D.

Field duplicate samples will be collected at a frequency of 5% (1 for every 20 samples).

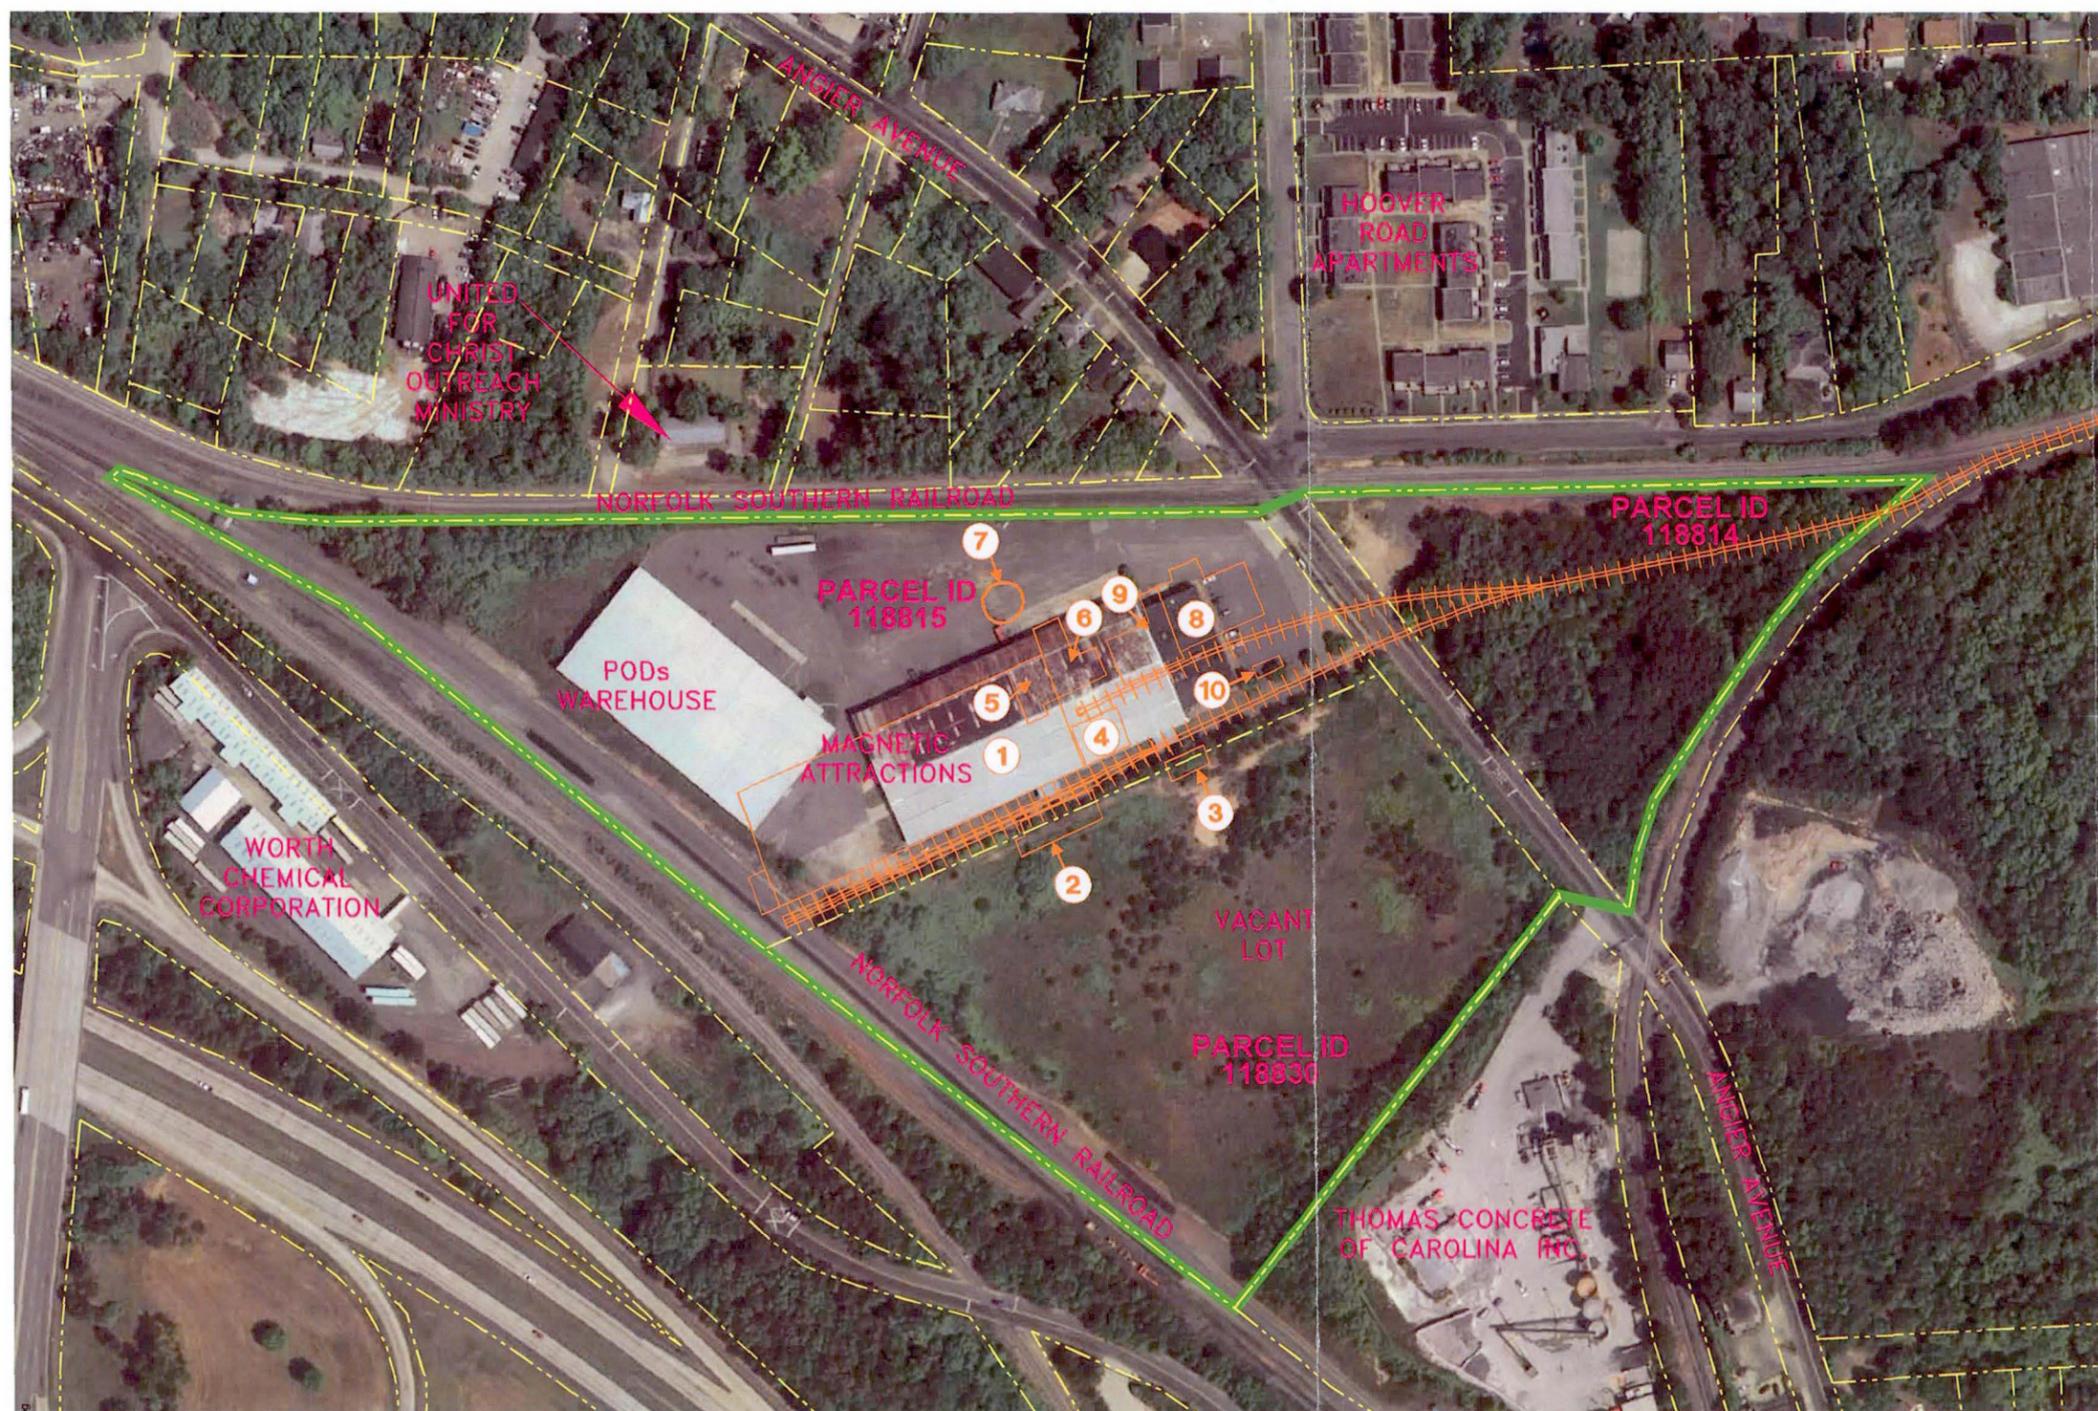

Equipment rinse blanks will be collected at a frequency of one per day.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) samples will be collected at a frequency of 5% (1 for every 20 samples).

Geoff -

I have reviewed the Removal Site Evaluation (RSE) Work Plan for the former Virginia Carolina Chemical (VCC) facility in Durham, NC and approve the report as submitted. Please proceed with obtaining access agreements from the required properties, and keep Ken Mallary and David Mattison (NCDENR) apprised of your progress and sampling schedules.

Thank You,

Craig Zeller, P.E.

Craig and Dave-

Attached for your review and comment is the RSE work plan for the VCC Site in Durham, NC. Hard copies of the document are also being shipped to your attention. Once we receive your comments and finalize the document we will approach the property owner to request access. Please review and forward any comments that you may have back to me at your earliest convenience.
Thanks-

Geoff

MEETING REPORT

Subject:

Minutes from 1/14/10 Conference Call to discuss Winston-Salem VCC Soil Removal Schedule and Public Relations

Department:
Environment

ARCADIS Project No.:
B0085732

Place/Date of Meeting:
Conference Call / January 14, 2010, 2 PM

Issue Date:
January 14, 2010

Minutes by:
Matt Pelton

Participants:
Ken Mallery (USEPA)
David Mattison (NCDENR)
Steven Schmidt (ExxonMobil)
Geoff Germann (ARCADIS)
Matthew Pelton (ARCADIS)

Action by:	Number:	Comments:
	1	Conference call was requested by Ken Mallery of USEPA to discuss the proposed schedule for the soil removal activities at the VCC Winston-Salem site. Ken noted that he had received the Site Delineation Report/Removal Action Work Plan (SDR/RAWP) and had started his review. He stated that he plans to complete his review and provide comments by January 22, 2010.
	2	David Mattison confirmed that he would provide comments to Ken Mallery by January 21st. David asked that a copy of the SDR/RAWP be forwarded to Collin Day for his review as well. David confirmed that all comments from NCDENR, including any comments from IHSB, will be sent to ExxonMobil from him.
	3	Ken proposed some further dates to accomplish critical items in the process leading up to construction: <ul style="list-style-type: none">• Finalize SDR/RAWP by January 29, 2010 pending comments from USEPA and NCDENR.• USEPA to complete AOC and Action Memo by February 5, 2010.

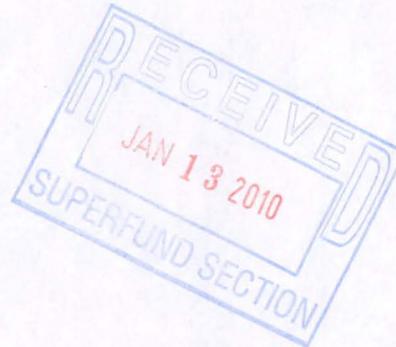

ARCADIS

- Public Notice would be issued following completion of the AOC and mailing of final SDR/RAWP to information repository in Winston-Salem, target date of February 5, 2010.
 - Public notice period will be 30 days, if started on February 5th it will end on March 8th, one week before intended mobilization for construction on March 15, 2010. No public meeting is required under the Time Critical Removal action, however, meetings/interviews with local officials will be planned for just before construction.
- 4 Ken noted that the USEPA public affairs representative would be Tonya James. Steve noted that the EMES public affairs efforts would be lead by Gideon Lett with APCO. ARCADIS/APCO on behalf of EMES will draft public affairs information for the site and provide to USEPA for review and use.
- 5 Action items from the call include the following:
- Matt Pelton to forward on a copy of the SDR/RAWP to Collin Day with NCDENR.
 - Steve Schmidt to contact EMES and USEPA counsel to provide the above schedule and coordinate timing on the AOC.
 - ARCADIS and APCO to being working on public affairs information for the site.

Former VCC Winston-Salem Site: Site Delineation Report/Removal Action Work Plan
Winston-Salem, North Carolina

Dear Mr. Mallery:

Please find enclosed for your review two (2) copies of the *Site Delineation Report/Removal Action Work Plan (SDR/RAWP)* for the Former VCC Winston-Salem Site (Site) located in Winston-Salem, Forsyth County, North Carolina. This SDR/RAWP has been prepared by ARCADIS U.S., Inc. (ARCADIS) on behalf of ExxonMobil Environmental Services Company (EMES) to document soil and groundwater sampling activities conducted at the Site and to guide proposed soil removal activities at the Site. If you have any questions, please feel free to call me or Steve Schmidt of EMES at 703.846.1005.

Subject:
Removal Site Evaluation Work Plan
Former Virginia-Carolina Chemical Corporation Site
Charlotte, North Carolina

Dear Mr. Zeller:

This work plan presents Exxon Mobil Environmental Services Company's (ExxonMobil's) approach for conducting a Removal Site Evaluation (RSE) at the former Virginia-Carolina Chemical Corporation (VCC) fertilizer plant located in Charlotte, Mecklenburg County, North Carolina. The objective of this RSE Work Plan is to collect soil data for initial screening purposes to identify whether the site contains constituents related to historic activities associated with the VCC Charlotte operations.

Background

Virginia-Carolina Chemical Company purchased the site from Charlotte Oil and Fertilizer Company in 1901. At the conclusion of Virginia-Carolina Chemical Company's bankruptcy and reorganization proceedings in 1926, VCC of Richmond, Virginia emerged as a new company and continued to own the Charlotte fertilizer plant until 1970. VCC merged into Socony Mobil Oil Company, Inc. in 1963, and the company name changed in 1966 to Mobil Oil Corporation. Mobil Oil Corporation sold the Charlotte plant site in 1970 to Swift Agricultural Chemical Corporation. In 1999, Exxon Corporation merged with Mobil Corporation to form Exxon Mobil Corporation. Mobil Oil became ExxonMobil Oil Corporation, the corporate successor to VCC. Exxon Mobil Corporation is the parent company of ExxonMobil Oil Corporation.

The former VCC fertilizer plant was located in Charlotte, Mecklenburg County, North Carolina. Figure 1 depicts the location of the former Charlotte property on a portion of the United States Geological Survey (USGS) 7.5-minute quadrangle map for East

and West Charlotte, North Carolina. The current street address that most closely matches the former acid chamber location is 301 West Tremont Avenue. The geographical location of the center of the Site is at 35.21235° North Latitude and 80.86486° West Longitude (North American Datum of 1983 [NAD83]).

Figure 2 depicts the approximate former boundaries of the Charlotte Site superimposed on a 2009 aerial photograph. Figure 2 also depicts the approximate locations of historical site features digitized from Sanborn maps and aerial photographs. The Site is currently occupied with commercial and light industrial facilities located within the Tremont Center owned by Tremont Industrial Park LLC. The former Charlotte property can be accessed from West Tremont Avenue, which forms the northern boundary of the site. Most of the former site is currently paved as a parking lot or covered by the Tremont Center buildings.

During a site visit in October 2005, monitoring wells were observed on the former VCC Charlotte plant site and adjacent properties. The Groundwater Protection Unit of the North Carolina Department of Environment and Natural Resources (NCDENR) maintains a database with well construction records from 1988 to 2009. A search of the database was performed for Mecklenburg County. The database does not contain any records for wells located within 1,500 feet of the site boundary. Prior to conducting the sampling activities proposed in this work plan, an EDR Report will be ordered and reviewed for monitoring wells details in the vicinity of the Site. During implementation of the sampling activities, ARCADIS will field verify any on-site monitoring wells.

Surrounding land use of the former Charlotte property includes commercial and industrial facilities, residential apartments, restaurants, a music hall, a shopping mall, and an abandoned gas station. The nearest residential properties are approximately 2,500 feet to the southwest along South Tryon Road. Refer to Figure 2 for the listing of surrounding properties.

Currently, the former Charlotte site is occupied by two tax parcels owned by Tremont Industrial Park LLC. Property ownership information was provided by the Mecklenburg County GIS and Property Ownership Land Records Information System.

Imagine the result

Operational History

A review of the available Sanborn Fire Insurance maps confirmed that the facility was a complete factory with acid production facilities. Based on the historical information fertilizer manufacturing began at the plant site prior to 1890 and continued until sometime between 1929 and 1934. Therefore, acid production after the bankruptcy and reorganization proceedings in 1926 was limited. During manufacturing, the facility had a single acid chamber structure that was replaced sometime between 1911 and 1929. The location of both acid chambers is shown on Figure 2. In addition to the acid chamber, sulfur burners were present on-site in the 1890's and early 1900's, indicating that the plant burned sulfur in the production of acids.

Structures associated with the former VCC Charlotte plant included a fertilizer building (mixing and storage), one acid chamber structure (located in two different areas of the site at different points in time), and associated burners, dry mixing plant, supply house, wash house, railroad sidings, a fertilizer factory, a fertilizer warehouse, a bag house, a 50,000-gallon water tower, and an office. Figure 2 depicts the general locations of the former site features.

Proposed RSE Sampling Activities

This RSE Work Plan includes provisions for the collection and analysis of soil samples to confirm the presence or absence of potential operations-related constituents. Based on experience at other VCC sites, operations related constituents are arsenic and lead. In addition, the presence of low pH (i.e., less than 6.5 standard units) is a typical indicator of historical acid production processes conducted at former VCC sites. Therefore, samples collected at the Charlotte Site will be analyzed for arsenic, lead, and pH. The locations of all soil samples described below are tentative. Actual locations may be adjusted in the field depending on direct observations and site logistics/access limitations.

All samples will be collected in accordance with the United States Environmental Protection Agency (USEPA) Region 4 *Field Branches Quality System and Technical Procedures* [USEPA, Region 4, Science and Ecosystem Support Division (SESD), most current versions of applicable procedures will be followed]. The proposed sampling approach for the RSE is summarized below.

Imagine the result

Soil Sampling Program

A total of 24 soil borings are proposed for the Charlotte Site. The soil sampling program was developed using USEPA's Judgmental Sampling methods described in *Guidance of Choosing a Sampling Design for Environmental Data Collection* (USEPA, 2002). Judgmental Sampling allows for the use of professional judgment in order to bias sample locations towards areas of known historical use (e.g., acid chambers, sulfur storage areas). Soil borings in locations outside the former plant area were biased toward areas where there is the potential for human contact to soil. Figure 3 depicts the proposed soil boring locations. Additional soil borings may be advanced at the discretion of ExxonMobil or at the request of the USEPA. Prior to intrusive activities, ARCADIS will coordinate with local utility companies and a private subsurface utility locating service to identify and mark all subsurface utilities near the proposed boring locations. Boring locations may be adjusted in the field based on the presence of existing utilities or other access limitations.

Soil Screening and Analysis Procedures

Soil borings will be advanced at each location using a stainless steel hand auger from the ground surface to a maximum depth of 4 feet below ground surface (ft bgs), or until refusal or groundwater is encountered, whichever occurs first. Each boring interval (0 – 0.5, 0.5 – 2.0, and 2.0 – 4.0 ft bgs) will be screened for lead and arsenic in the field using a portable X-ray fluorescence (XRF) unit. Soil samples will be collected from each boring interval and submitted to TestAmerica Laboratories of Nashville, Tennessee for arsenic, lead, and pH analysis. A summary of the proposed soil sampling program is provided in Table 1.

Surface Water and Sediment Sampling Program

Based upon the aerial photograph and a site visit conducted in October 2005, the majority of the site is covered with impervious surfaces. Therefore, no surface water or sediment samples are expected to be collected. However, if any surface water/drainage features are observed during the site investigation ARCADIS will be prepared to collect sediment and/or surface water samples, if appropriate.

Surface water and sediment sampling, if required, will be conducted using the applicable procedures provided in the USEPA Region 4 *Field Branches Quality System and Technical Procedures*. Co-located surface water and sediment samples will be collected from locations identified in any major drainage pathways on the site.

Imagine the result

Surface water samples will be collected prior to sediment sampling in a downstream to-upstream direction. Surface water samples will be collected by directly filling the sample containers from as near as practical to the center of the waterbody. Following sample collection, water quality parameters will be monitored for pH, temperature, specific conductivity, DO, ORP, and turbidity at the depth from which the sample was collected using a water quality meter. Sediment samples will be collected from the top 6 inches of the sediment using a stainless steel scoop. At each sediment sample location the total water depth and sediment characteristics will be noted. Any surface water/sediment samples that are collected will be submitted to TestAmerica Laboratories of Nashville, Tennessee for arsenic and lead analysis. Sediment samples will also be analyzed for pH by the laboratory.

Quality Assurance/Quality Control

All sample procedures will be performed in accordance with the methods identified in the USEPA Region 4 Field Branches Quality System and Technical Procedures. Sampling equipment will include both disposable and re-usable components. Disposable equipment that comes in contact with the soil will be contained in properly labeled 55-gallon United Nations (UN)-approved steel drums and disposed appropriately. Re-usable equipment will be decontaminated prior to, and in between use, in accordance with the decontamination procedures identified in the USEPA Region 4 *Field Branches Quality System and Technical Procedures*. All samples will be analyzed in accordance with USEPA SW-846 procedures with Contract Laboratory Program (CLP)-like data packages. Quality assurance/quality control (QA/QC) procedures will include the collection and analysis of blind field duplicates, equipment rinsate blanks, and matrix spike/matrix spike duplicate (MS/MSD) samples. The number and frequency of QA/QC samples are summarized in Table 1.

Surveying

All proposed soil boring locations will be staked (or marked) in the field and documented using global positioning system (GPS) methods.

Investigation Derived Waste

All investigation derived waste (IDW) including soils, plastic, decontamination fluids, and personal protective equipment (PPE), will be containerized in properly labeled UN-approved 55-gallon steel drums. Laboratory analysis of each media (i.e., soil and water) will be performed by TestAmerica on a quick turn-around schedule to

Imagine the result

minimize the amount of time that the drums are staged on-site. Drums containing solids will be analyzed for toxicity characteristic leaching procedure (TCLP) metals and drums containing water will be analyzed for Target Analyte List (TAL) metals and pH (Table 1). IDW disposal requirements will be based on the analytical results and IDW disposal will be performed at an ExxonMobil selected facility.

Property Access Agreements

ExxonMobil will obtain an access agreement from the property owner affected by the proposed RSE activities. The current mailing address for Tremont Industrial Park LLC, the property owner, is PO Box 36007, Charlotte, NC 28236. Upon USEPA approval of this RSE Work Plan, and negotiation of the necessary access agreements, ExxonMobil will proceed with the implementation of this Work Plan for the Charlotte Site. Work activities could likely be initiated within 30 days of USEPA approval and obtaining access agreements.

Sincerely,

ARCADIS

Kirstyn E. White, P.E.
Staff Environmental Engineer

Table

Table 1
Soil and IDW Sample Analytical Program
Charlotte, Mecklenburg County, North Carolina
Removal Site Evaluation Work Plan

Parameter	Estimated Number of Borings ¹	Estimated No. of Samples per Boring ¹	Estimated No. of Field Samples ¹	Estimated No. of Field QC Samples			Total No. Field + Field QC Samples ¹	No. of MS/MSD Sample Sets
				Duplicate	Rinse Blank	Trip Blank		
Soil Samples								
Arsenic and Lead	24	3	72	4	5	0	81	4
pH	24	3	72	4	5	0	81	4
IDW Samples (Solid)								
TCLP Metals	--	--	1	0	0	0	1	0
IDW Samples (Aqueous)								
TAL Metals	--	--	1	0	0	0	1	0
pH	--	--	1	0	0	0	1	0

Notes:

Arsenic and lead and TCLP Metals will be analyzed via USEPA SW-846 6010C.

pH for soil samples will be analyzed via SW-846 9045D.

pH for water samples will be analyzed via SW-846 9040C.

TAL metals will be analyzed via EPA 200.7.

IDW = Investigation Derived Waste.

TAL - target analyte list

TCLP - toxicity characteristic leaching procedure.

MS/MSD = Matrix Spike/Matrix Spike Duplicate.

¹ The number of borings and total number of samples are approximate. Approximately 3 soil samples will be collected from each soil boring unless shallow refusal or groundwater is encountered.

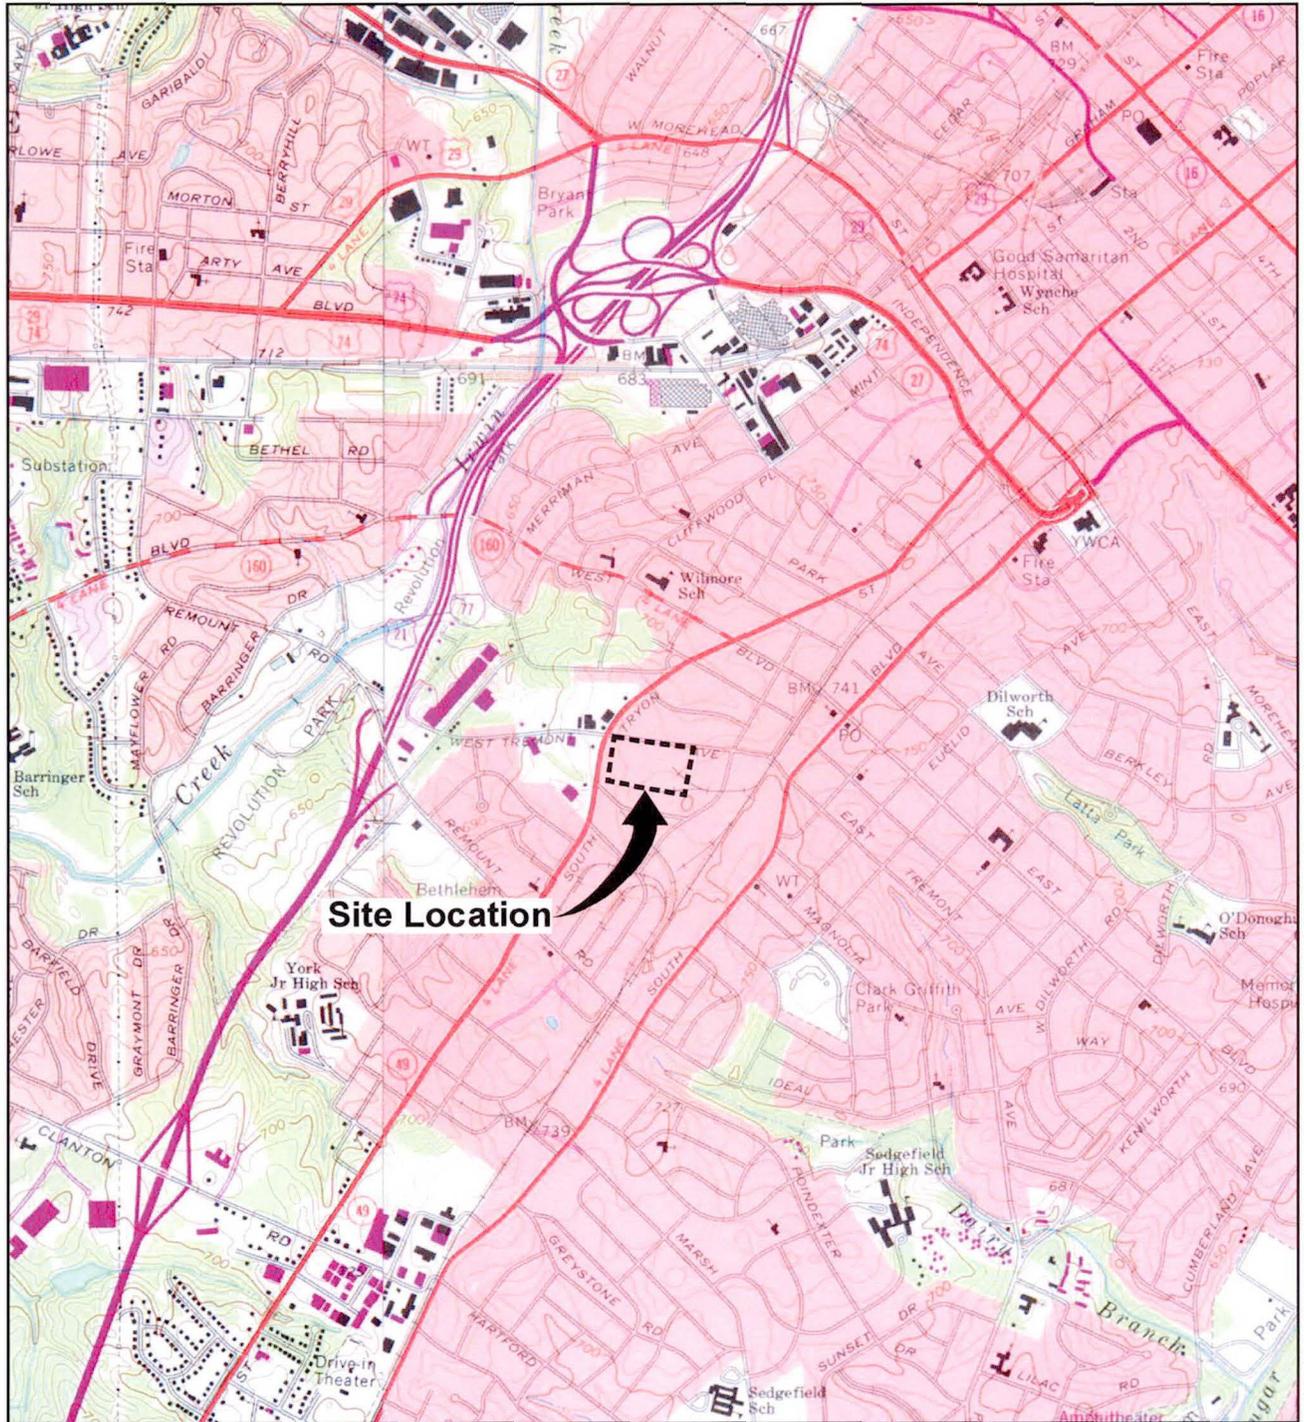

Field duplicate samples will be collected at a frequency of 5% (1 for every 20 samples).

Equipment rinse blanks will be collected at a frequency of one per day.

MS/MSD samples will be collected at a frequency of 5% (1 for every 20 samples).
