Zinith,

I have a question about the abandonment of monitoring wells and piezometers associated with the development of Phases 3 and 4 at the White Oak Landfill in Haywood County. The County will construct MSW Phase 3 this year and then MSW Phase 4 in about 5 years or so. What I'm wondering is: will the potentiometric surface that BLE has identified in the Permit To Construct be sufficient to obtain a Permit To Construct MSW Phase 4 in 5 years? The County would like to abandon the piezometers in the Phase 4 area when they perform abandonment of the wells and pz's in the Phase 3 area, in about 3 weeks. If there's a chance that you would additional monitoring of groundwater levels in 5 years, then it would make sense to keep the Phase 4 pz's active at this point, then abandon during the construction of Phase 4. But like I say, the County would like to abandon all of the pz's at this point in order to facilitate getting borrow soils from the Phase 4 area for the next 5 years. Any insight into this matter would be greatly appreciated.

I understand from Allen Gaither that we will be getting technical review letters in the coming weeks. We look forward to that and addressing any concerns that you may have. Give me a call if you have any questions regarding this project or if you want to discuss the abandonment of monitoring wells and piezometers.
