Raleigh, NC 27611-7687

Re: Construction Record Documentation Report
Halifax Coal Ash Monofill - Cell 1
H&S No. 3716

Dear Mr. Coffey:

Enclosed are five copies of the Construction Record Documentation Report for the above referenced facility. This report satisfies the conditions outlined in the "Amendment to Solid Waste Permit No. 42-04", dated May 12, 1993. With the submittal of this report, Halifax County requests issuance of an Operating Permit for the Coal Ash Monofill - Cell 1.

As you are aware, Halifax County is expecting that coal ash will soon be generated by the power plant for disposal. If Hazen and Sawyer can answer any questions or otherwise expedite approval, please contact us.

Very truly yours,

HAZEN AND SAWYER, P.C.

Re: Construction Record Documentation Report
Halifax Coal Ash Monifill - Cell 1
H&S No. 3716

Dear Mr. Phillips:

Construction for the Halifax County Coal Ash Monofill - Cell 1 was essentially completed as of January 18, 1994. Hazen and Sawyer was responsible for Construction Management and Construction Quality Assurance (CQA) during facility construction. Our representatives observed critical elements of construction on a full time basis, reviewed contractor submittals and conducted testing.

Enclosed please find our Construction Record Documentation Report for Cell 1 of the Coal Ash Monofill. The report presents narrative descriptions of the following main elements of construction:

Section 1 - Introduction
Section 2 - Earthwork
Section 3 - Geomembrane
Section 4 - Internal Stormwater System
Section 5 - Operational Cover
Section 6 - Monitoring Wells
Section 7 - Record Drawings

Test data, monitoring results, etc. are provided in appendices at the end of each section. The Record Drawings reflect as-built conditions within the Cell and the main elements of construction. They are provided separately. The Water Quality Monitoring Plan and monitoring well installation was the responsibility of Armstrong Geological & Engineering Services, P.C.

On the basis of our observation and testing, and the documentation provided herein, Hazen and Sawyer, P.C. certifies that to the best of our knowledge and belief that construction was completed in general accordance with the Contract Plans and Specifications. Any known additions or modifications to construction are noted in this report.

We appreciate the opportunity to provide construction services to Halifax County during Cell 1 - Coal Ash Monofill construction. If you have any questions or require additional information, please contact us.

Very truly yours,

HAZEN AND SAWYER, P.C.

SECTION 1
OVERVIEW

1.0 INTRODUCTION

1.1 Projection Description

This report provides record documentation for construction of the Halifax County Coal Ash Monofill - Cell 1. This facility is located on the existing County Solid Waste Management Facility near Aurelian Springs in Halifax County, NC. The Ash Monofill will be operated by the Halifax County Solid Waste Department. The coal ash to be landfilled will originate at the Westmoreland Energy coal-fired power plant located in Weldon, NC. The residue from this plant is the only material to be placed in this facility.

Cell 1 was approved for construction under an amendment to Solid Waste Permit No. 42-04, part 1: Permit to Construct a Coal Ash Monofill, issued May 12, 1993 by the North Carolina Department of Environment, Health and Natural Resources (NCDEHNR).

Cell 1 of the Coal Ash Monofill is approximately 12 acres in size. It is located on the northeast quarter of the County landfill property as shown on Figure 1.1. This cell represents the initial phase in a planned 36 acre ash monofill. The design life for Cell 1 is approximately five years.

The ash monofill consists of a geomembrane installed over on-site compacted prepared subgrade soils. A layer of cohesive operational cover soil was placed over the geomembrane. An internal runoff collection system was installed along the south (intermediate) berm. The collection system conducts surface water runoff that potentially contacts the coal ash to the internal stormwater basin via a sump and a gravity line.

To monitor the surrounding groundwater, a total of seven monitoring wells were installed by Parratt Wolff, Inc., under contract with Halifax County.

Complete descriptions of construction of each main element of the monofill are provided in subsequent sections. Record Drawings are provided in Section 7 of this report. For convenience, a reference Cell 1 grading plan is presented on Figure 1.2.

1.2 Scope of Services

Hazen and Sawyer, P.C. was retained by Halifax County to provide Construction Management (CM) and Construction Quality Assurance (CQA) services during construction. Hazen and Sawyer is also the facility designer.

Barnhill Contracting Co. was awarded the construction project and was responsible for Construction Quality Control.

Hazen and Sawyer provided a Resident Engineer during critical portions of construction. The engineering staff reviewed all contractor submittals for materials and equipment to assure compliance with the specifications. Hazen and Sawyer contracted with Geotechnologies, Inc. to provide inspection and testing services for earthwork and geomembrane installation. Resident Engineer and Geotechnologies, Inc. daily field reports are presented in Appendices 1.1 and 1.2, respectively.

1.2.1 Project Criteria

The goal of the CQA effort is to assure that construction is completed in accordance with the permitted project plans and specifications as well as the criteria outlined in the facility design and construction permit. The following documents were incorporated into the project construction and CQA:

- Contract Documents "Cell 1 - Ash Monofill Halifax County Solid Waste Department", prepared by Hazen and Sawyer, June, 1993 (Contract Plans and Specifications)

- Construction Permit - "Amendment to Solid Waste Permit No. 42-04" dated May 12, 1993 prepared by NCDEHNR

- Construction Permit Application - Prepared by Hazen and Sawyer dated April 27, 1992, including:

    - Design Drawings
    - Specifications
    - Construction Quality Assurance (CQA) Plan
    - Operations Manual

1.3 Project Schedule

The construction contract was awarded to Barnhill Contracting Company of Tarboro, NC on August 5, 1993. Notice to Proceed was issued on September 1, 1993. Clearing, grubbing and construction of erosion control structures was initiated in early September.

Excavation and construction of perimeter berms commenced soon after clearing and grubbing was completed. The Geomembrane was installed in late November and early December. The monofill construction was essentially completed on January 15, 1993. A summary of project milestones is presented on Table 1.1.

TO

THE FOLLOWING WAS NOTED:

The following was discussed w/ Kenneth Atkins (Barnhill), Drew Johnson (Barnhill) & Jake Keeny (Joyner Keeny - Surveyor):

- The baseline for the South end of Cell 1 is staked & 2 pans are currently working this area
- Stockpile B Coords. are off - need to recheck and adjust for MW-8 & B-3 so that these won't be knocked out
- Decided to shift clearing limits in 10' from Northeastern property line
- Contractor wants to set up a haul road across berm at Sed. Basin #2 & set up a small sump in the creek to pump water for his water truck (Sump o.k. if disturbance is repaired at end of project).
- Surveyor could not locate either MW11 or B-7; but the one he did locate is outside the clearing limits
- Surveyor gave the following Coords.: MW8: N 959780.35, E 2350290.61, B-3: N 959880.54, E 2350678.21, NE Property Corner (Iron Pin): N 960010.96, E 2350722.39

K. Atkins & D. Johnson - Barnhill	

TO

THE FOLLOWING WAS NOTED:

Barnhill has become concerned about the payment for clearing. Existing piles of debris are of particular concern in that the soil in the piles is making it difficult to burn these piles.

Observation of the areas around MW-9 & MW-11 indicate that these wells do not exist.

Dan with Joyner Keeney (Surveyor) was advised that all necessary points for surveying the site should be included on their disk.

Site activity included excavating (2 pans), clearing & grubbing (Bulldozer & Trackhoe) along line for leachate pipe, and burning of two piles of debris.

TO

THE FOLLOWING WAS NOTED:

ARRIVED ON SITE @ 12:00 PM

BARNHILL WAS HAULING TO STOCKPILES

WENT TO CHECK OUT SED BASIN 1 WITH JOHN ADAMS (GEOTECH)

BARNHILL HAD PLACED ALL OF 1 PIPE BUT JOHN SAID SUBGRADE WAS NOT ADEQUATE VERY MUCKY & PUMPING DOWN TO 3'

THEREFORE HAD BARNHILL TAKE OUT PIPE AND DIG OUT BAD SOIL.

BARNHILL (KENNETH) WAS VERY INTERESTED IN AMOUNTS

I ESTIMATE 100 - 150 CUBIC YARDS OF UNDERCUT THE REMAINING SHOULD BE CLASSIFIED AS GRUBBING DUE TO ROOTMAT

TO

THE FOLLOWING WAS NOTED:

THE LINER INSTALLER DEPLOYED THE PANELS UNTIL THEY RAN OUT OF LINER IN THE MORNING. THESE PANELS WERE SEAMED AND TESTED, WHILE EXTRUSION PATCHES WERE BEGUN IN SOME AREAS. AFTER LUNCH, THE REMAINING LINER MATERIAL ARRIVED AND WAS DEPLOYED. THERE WERE SEVERAL INSTANCES WHERE THE WIND CAUGHT THE LINER - WHICH CAUSED WRINKLES & CREASES IN THE LINER. THE WIND BLEW THE SEAMED PANELS ON THE SIDE SLOPES - WHICH INTERUPTED WELDING AND CAUSED SEVERAL DEFECTS AND CREASES. THE CELL WAS COMPLETELY "BLACKED IN" BY 4:30 PM AND WELDING CONTINUED AFTER DARK & W/O OUR SUPERVISION AFTER 5:15 PM. EACH WELDER AND EXTRUSION WELDER WAS TESTED IN THE MORNING, IN THE AFTERNOON, AND WITH ANY CHANGE OF WELDERS.

TIME: 10.5 hrs.

MILEAGE: 180 1 TRIP DAY

ARRIVED ON SITE BY 8AM AND SET UP EQUIPMENT. TOOK FIRST TEST AFTER SHEEPS FOOT MADE A FEW PASSES. TEST SITE STILL OUTSIDE BERM ON ACCESS ROAD. FIRST TEST WAS SO WET, TECH HAD TO DRY BACK SAMPLES BEFORE BEATING OUT CHECK PLUGS FOR MOIS. AFTER 10 MIN. DRY BACK, SAMPLES STILL HAD MOISTURE CONTENT OF 11.9% AND CHECK PLUG WAS CONSIDERABLY LIGHTER. COMPACTION IS THERE, BUT MOIS. IS STILL TOO WET. BUT TESTS PASSED BECAUSE THERE IS NO MOIS. CONTROL ON THIS AREA (ACCESS ROAD). ALL TESTS ARE DRY BACK FOR THIS AREA. TECH. NOTICED FULL PANS MAKE AREA PUMP EASILY. DRIED BACK ALL TESTS. MOISTURES STAYED BETWEEN 11 - 15% WITH 10 MIN DRY BACK TIME. LAST TEST, DRIED MOIST. AS IS. CAME OUT AT 24.3%, SO HOPEFULLY, THE DEEPER WE CUT FOR FILL, THE BRIER.

THE FOLLOWING WAS NOTED:

TIME: 10.5

MILEAGE: 140 mi

UPON ARRIVAL TECH SET UP EQUIPMENT AND MADE FIRST TEST. MOISTURE LEVEL HAS GONE DOWN ENOUGH TO USE FILL ON BERM, BUT STILL ADDING ONTO ACCESS ROAD & UNLOADING AREA. HAD TO SWITCH LOCATIONS FILL WAS COMING FROM, SO A SLIGHT DELAY BECAUSE TECH WOULD NOT ALLOW TOPSOIL FROM NEW CUT TO BE PLACED ON AS FILL SOIL. WHEN CLEAN FILL IS FOUND, OPERATIONS CAN RESUME. BOTH FIRST TWO TESTS ARE DUETTER THAN OPTIMUM, SO DRY BACK PROCEDURE WILL BE UTILIZED. KENNETH HAS INFORMED TECH THAT UNSUITABLE FILL IS BEING STRIPPED OFF & UNTIL SUITABLE MATERIALS CAN BE FOUND COMPACTION TESTS WILL ALSO BE TAKEN ON STORM DRAIN DITCH AFTER COMPACTION. STORM DRAIN WILL RUN UNDER ACCESS RD. SO 95% OR BETTER MUST BE ACHIEVED. AROUND 1 PM, MORE FILL MATERIAL WAS DUMPED BY PAN ON ACCESS ROAD AREA, HOWEVER, IT TOO, WAS FULL OF ROOT SYSTEMS AND DEBRIS. TECH HAD CONTRACTOR SCRAPE IT OFF AND FILL MATERIAL INSPECTED FROM THAT POINT ON. GOOD FILL WAS LOCATED AND OPERATIONS BACK TO NORMAL. TOOK FIRST TEST ON DITCH, PASSED EASILY. LAST TEST ON LOT PASSED AND MOISTURE WAS DOWN TO 23.3% WHICH IS PASSABLE FOR ALL AREAS.

SECTION 2
EARTHWORK

2.0 EARTHWORK

For this project, earthwork includes cut and fill operations, fine grading and testing related to soil excavation and Compacted Embankment. A brief discussion of Erosion and Sediment Control structures is also included in this section.

The Contractor was responsible for layout during earthwork operations. The layout grid was established and maintained by survey methods. Hazen and Sawyer contracted with an independent surveyor to confirm the Contractor's Construction Baseline layout.

2.1 Cell Excavation

As the first step in excavation, the Contractor established the grid layout on the basis of the construction baseline provided on the Contract Drawings. Excavation for Cell 1 began on a ridge in the eastern area of the cell footprint.

During excavation, the subgrade condition was evaluated visually by a Hazen and Sawyer representative. Any topsoil, organic materials, debris or otherwise unsuitable materials that were encountered were removed and not used for cell construction. Any such materials encountered at proposed subgrade elevations were removed and replaced with Compacted Embankment (see Section 2.2).

The soils encountered consisted of cohesive sandy to clayey silts. No groundwater was encountered during excavation of Cell 1, sediment basins or the gravity line and sumps. Large rock "floaters" were locally encountered during excavation of Sediment Basin No. 2 and the southern limits of the Internal Stormwater System header pipe.

These floaters were removed with earth moving equipment. No blasting or excavation with rock tools was necessary. Areas where removal of boulders resulted in over-excavation were brought back to grade with Compacted Embankment. The on-site soils were otherwise generally free of large rock fragments or cobbles.

Excavated soil was used directly for berm construction, or placed in one of three on-site stockpiles. The stockpile locations are provided on Drawing G3, Section 7. Stockpile A, located to the south of the active MSW landfill area, was used to store daily cover material for that facility. Stockpile B is adjacent to the northern perimeter berm. This stockpile was used to store soil for Operational Cover during cell construction and will be used during Ash Monofill operations. Stockpile C was designated as a contingency stockpile and was not used. Stockpile D is located to the south of Cell 1 and will be used to provide cover for the County as required. Exposed areas on Stockpiles B and D were seeded by the Contractor.

Excavation for Cell 1 was completed using scrapers and dozers. Fine grading was accomplished with motor-graders and hydraulic excavators. In areas where the design subgrade was in cut, the subgrade was left 6-12 inches above design elevations in order to protect the subgrade from erosion or excessive moisture.

Portions of the northern perimeter berm and the Intermediate berm were undercut in accordance with the Contract Drawings in order to provide proper interlocking with the structural fill. These areas were cut to design subgrade elevations and benched or scarified.

2.2 Compacted Embankment

The controlled compacted structural fill used for construction of perimeter berms, geomembrane subgrade, pipe backfill, access roads and portions of sedimentation basins is referred to as Compacted Embankment. The Compacted Embankment consisted of on-site cohesive soils free from topsoil, debris and other unsuitable materials. Compacted Embankment consisted solely of soils excavated for cell header pipe or sedimentation basin construction. Areas where Compacted Embankment was placed are shown on the Record Drawings, Section 7.

The compaction criteria for the Compacted Embankment for this project are as follows:

- Density: Minimum 95% Standard Dry Density (ASTM D698)
- Moisture Content: Minimum 1% below to 6% above optimum moisture content (ASTM D698) <u>for geomembrane subgrade only</u>
- Lift Thickness: 10-inch max (loose measure)

Prior to placement of Compacted Embankment over excavated areas, the areas were proofrolled using loaded scrapers. No evidence of unsuitable subgrade (e.g. pumping, etc) was observed in the Cell 1 area. Portions of the entrance roadway subgrade west of Cell 1 were soft due to accumulation of surface water runoff. These areas were undercut to depths ranging from 1 to 3 feet and replaced with

Compacted Embankment. Subgrade for the Internal Stormwater System pipe was firm and free from unsuitable materials.

Construction of the northern perimeter berm began on September 27. Representatives of Geotechnologies, Inc., the soils testing firm under Contract to Hazen and Sawyer, monitored fill placement on a full time basis. The technicians visually classified the soils and monitored loose lift thickness during placement. Any areas where lift thickness was excessive were graded out or removed by the Contractor prior to compaction. The lifts were placed evenly, essentially parallel to the subgrade surface. Soil was placed by scrapers and leveled using dozers.

Each lift Compacted Embankment was compacted using a REX 340 penetrating foot compactor. At the end of each work day, or whenever inclement weather was expected, the exposed subgrade was "seal rolled" using a SAKAI SV91-TF smooth drum roller. Prior to placement of overlying lifts in these areas, the smooth surface was scarified.

Any areas that exhibited evidence of excessive moisture or other damage were repaired by the Contractor.

In order to confirm that the Compacted Embankment met compaction criteria; Geotechnologies, Inc. conducted a total of 128 in-place density tests. The location of each test conducted on the Cell was plotted on a testing grid and the results recorded. The testing grid is presented on the "Soil Testing Grid Layout", Drawing CQA-1, Appendix 2.2.

If the results of any in-place density test indicated a non-conforming area, the Contractor employed the required remedial measures. A summary of Compacted Embankment in-place density tests conducted by Geotechnologies, Inc. is presented in Appendix 2.1.

As the Compacted Soil Liner in Cell 1 reached final grades, additional soil was placed to protect the surface from desiccation or erosion. Prior to geomembrane deployment, these areas were fine graded to design subgrade elevations using a motor grader.

Upon completion of earthwork operations, Hazen and Sawyer retained Burr & Associates to record as-built grades. Burr & Associates as-built data for the geomembrane subgrade elevations are provided on Drawing No. B&A 5-142 dated December 11, 1993 and presented in Appendix 2.4. As-built data confirm that the lines and grades for Cell 1 construction very closely match those in the Contract Drawings. The Burr & Associates survey form the basis for the record drawings presented in Section 7 of this report.

2.3 Erosion & Sediment Control

Erosion and sediment control measures were constructed in accordance with the NC Sedimentation Control Act (15 NCAC, Chapter 4) and the approved Erosion and Sedimentation Control Permit. Sedimentation Basins No. 1 and 2 (see Drawing G3, Section 7) were redesigned in the field by Hazen and Sawyer engineers to conform to existing site topography. These basins have capacities equal to or greater than the original design. Additional temporary erosion control structures, such as silt fence and temporary sediment traps were constructed as required. The Contractor was responsible for maintenance of these structures throughout the construction period.

The Internal Stormwater Basin, which retains and treats runoff from within Cell 1, was constructed as shown on Drawing G6, Section 7.

A site plan presenting both temporary and permanent erosion and sediment control structures is shown on "Cell 1 - Erosion and Sediment Control Plan", Drawing G13, Section 7.

2.4 Access Road

Construction of the 24 foot wide access road to the ash monofill began on October 14, 1993 at the intersection with the existing landfill access road. A small portion of undercut was needed due to soft organic soils and appropriate structural fill was placed. Approximately four (4) feet of fill was required to bring the road up to design subgrade elevations.

Once proper subgrade lines and grades were obtained, a Separator Geotextile was installed and a 6-inch lift of aggregate base course (ABC) was placed. The Separator Geotextile was pretensioned by construction traffic. During closeout, the remaining 6-inch lift of ABC was placed. A typical roadway section is shown on Drawing G10, Section 7.

SECTION 3
GEOMEMBRANE

3.0 GEOMEMBRANE

3.1 Overview

The geomembrane used for construction was 60-mil thick High Density Polyethylene (HDPE) manufactured by Polyflex, Inc. The material properties were submitted by the Contractor and reviewed for conformance with the project specifications by Hazen and Sawyer.

The geomembrane was installed by Environmental Design and Construction, Inc. of Huntsville, Alabama under Contract to Barnhill Contracting Co., the General Contractor.

Hazen and Sawyer conducted conformance testing on representative samples of the geomembrane delivered to the site to assure conformance with project criteria. The Geomembrane Producer was responsible for providing Quality Control Certificates for each roll as well as installation guidelines.

The installer was responsible for Construction Quality Control and non-destructive testing (NDT) of all geomembrane seams and repairs. Hazen and Sawyer provided full time Construction Quality Assurance (CQA) monitoring during installing and destructive testing of geomembrane seams.

3.2 Contractor Submittals

As required in the project specifications, Barnhill Contracting Co. submitted material specifications and qualifications of Polyflex, Inc., the geomembrane producer. As shown in Appendix 3.1, the submittals indicate that the 60 mil HDPE meets project criteria.

Additional geomembrane producer submittals, including a list of completed projects and the Quality Control manual have been retained in the Hazen and Sawyer file.

Barnhill also provided the resume of the installation superintendent as well as a list of completed projects for the installer. These have also been retained in the Hazen and Sawyer file.

On November 18, 1993, a pre-installation meeting was held at the project site. The meeting included representatives of Hazen and Sawyer, Halifax County, the General Contractor, the geomembrane installer and Westmoreland Energy. Project phasing as well as subgrade preparation and maintenance, geomembrane repair and testing requirements were discussed.

3.3 Geomembrane Inventory and Conformance Testing

A total of 71 rolls (624,375 square feet) of 60 mil HDPE geomembrane were delivered for Cell 1 construction. Polyflex provided Quality Control (QC) Certificates for each roll prior to shipment. Hazen and Sawyer reviewed each certificate for conformance with the geomembrane and resin properties outlined in the project specifications. On the basis of this review, each roll was approved for shipment. QC certificates for each roll are presented in Appendix 3.2.

Prior to shipment to the project site, representatives of AGP Labs removed samples from five rolls of geomembrane, randomly selected by Hazen and Sawyer. AGP then conducted conformance testing under contract with Hazen and Sawyer to assure that the geomembrane met project specifications. One sample was removed

for testing for each 200,000 square feet of geomembrane delivered with at least one test for each resin.

Results of the Conformance Testing program, which are provided in Appendix 3.3, indicate that each of the 5 samples tested meet or exceed project criteria for geomembrane.

The geomembrane was delivered to the site on November 17, 1993. At this time, a Hazen and Sawyer engineer inventoried each roll and checked the roll number against the roll numbers on the manufacturer's QC Certificates. Each roll of geomembrane delivered had an approved QC Certificate. The Geomembrane Inventory forms are provided in Appendix 3.4.

The geomembrane was delivered in 22.5 foot wide rolls and stored in the staging area north of Cell 1. The rolls were kept dry and stored away from areas where potential damage could occur.

3.4 Geomembrane Subgrade and Panel Deployment

Prior to geomembrane installation, the subgrade surface was prepared by Barnhill. The subgrade was graded to design elevations and rolled with a smooth drum vibratory roller. Any rocks or debris were removed from the subgrade surface and replaced with suitable soil. Sideslopes were prepared by blading with a dozer and raking by hand to a relatively smooth condition as required by the Specifications.

A Hazen and Sawyer engineer visually inspected the subgrade for rutted, uneven or otherwise unsuitable areas. Any such areas were repaired by the Contractor. No excess moisture was observed. When all required repairs were completed, the subgrade was approved.

Immediately prior to geomembrane placement, the Hazen and Sawyer Resident Engineer delineated the limits of approved subgrade and prepared a Subgrade Approval Form. This form was also signed by representatives of the Installer and General Contractor. Copies of these Subgrade Approval Forms are presented in Appendix 3.5.

Environmental Design and Construction deployed panels on sideslopes by manually pulling the sheet from the roll located on the top of the berm. The rolls were suspended from a hydraulic excavator with a sling. A loader was used to support and deploy the geomembrane on the base of the cell.

As each panel was placed, a Hazen and Sawyer representative confirmed that the subgrade was suitable, recorded the panel identification number, source roll number and panel dimensions. The panel number was also written on the geomembrane. Each panel was visually examined by Hazen and Sawyer soon after deployment for evidence of material damage or defects. Any such defects were marked on the panel for repair. Overlaps with adjacent panels were checked, and all exceeded the 3-inch minimum.

A total of 234 panels were placed between November 21 and December 1, 1993 by Environmental Design & Construction, Inc. Geomembrane was installed only over previously approved subgrade. Roll dimensions and documentation of any observed defects, etc. were recorded on a "CQA Panel Inspection Form".

Panels placed on the 2H:1V sideslopes extended a minimum of 10 feet past the toe. Geomembrane was then installed on the base of the cell in a generally east-west direction. Up-gradient geomembrane panels were placed over down gradient panels to promote runoff.

Panel Inspection forms prepared by Hazen and Sawyer for each of the 234 panels are presented in Appendix 3.6.

3.5 Geomembrane Seaming

Production seaming for the 60 mil HDPE was completed using double hot wedge fusion equipment. Patches, connection to the sump flange, and "T-joints" at adjacent panels were completed using extrusion welding methods.

3.5.1 Trial Seams

Test welds, or pre-welds, were completed by welding personnel before each shift began or whenever cold starts of welding equipment were required. Seaming temperature and rate were recorded. No production seaming was performed until test welds were completed by the installer and approved by Hazen and Sawyer. Test weld samples were tested in peel on site by representatives of the installer. Qualification criteria for pre-welds was that all peel specimens exhibit Film Tearing Bond (FTB) type failures. Any pre-weld sample that did not meet this criteria resulted in disqualification of the pre-weld. The installer then repaired or adjusted equipment and/or seaming procedures and prepared a new test seam, or the seaming equipment was marked as "out of service" and repaired.

Trial seam data were recorded by a Hazen and Sawyer representatives on "Trial Seam Report" forms. Completed forms are presented in Appendix 3.7.

3.5.2 Production Seaming

Each field seam was given a unique identification number by Hazen and Sawyer representatives. The seam number represented the two panels incorporated in the seam. For instance, Field Seam 1/2 identifies the field seam formed by Panels 1 and 2.

Panels were seamed on the day they were placed. Hazen and Sawyer representatives observed each seam and marked areas where "burn throughs" or other defects were observed. These areas were later repaired by the installer with a minimum 12-inch by 12-inch patch. The seam number, machine number, welder and seaming parameters were recorded for each seam. The CQA Seam Inspection Forms prepared by Hazen and Sawyer are presented in Appendix 3.8.

Prior to fusion seaming, Environmental Design and Construction, Inc. technicians inspected the overlap area and cleaned the seam area with dry cloths. Extrusion seam areas were prepared by beveling the edges of the 60-mil HDPE patch and grinding the seam area to remove texturing, surface oxidation and accumulated wax, dirt, etc. Patches were first bonded using hot air "Liester" equipment, then the extrusion seam was completed.

Hazen and Sawyer personnel observed preparation and seaming procedures and recorded any areas that were overheated or showed signs of excessive grinding outside of the extrusion seam area. Any such areas were cut out and repaired by the installer.

3.5.3 Nondestructive Seam Testing

Environmental Design & Construction, Inc. conducted nondestructive testing of all field seams. Fusion seams were tested using air pressure tests of the air channel between the inner and outer seams. Extrusion welds were nondestructively tested using a vacuum box.

For each double hot wedge fusion seam, the beginning air pressure, test duration and final air pressure were recorded. The length of the segment tested was also recorded.

The air channel pressure was monitored for at least five (5) minutes. A beginning air pressure of approximately 30 psi was used for testing. The maximum allowable pressure drop during the five (5) minute monitoring period was 4 psi.

Nondestructive testing information was recorded by Hazen and Sawyer on the CQA Seam Inspection Forms, Appendix 3.8 and by the installer. Installer testing summaries were submitted by the Contractor and retained in the Hazen and Sawyer file.

If the air channel did not hold pressure for the required period of time, the segment of seam tested was shortened in order to identify the defect area. Once the defect was located, it was repaired and the remaining portions of the field seam were again air tested. Fusion seams that did not pass the air test were cap stripped.

3.5.6 Destructive Seam Testing

Destructive seam evaluation was performed on production seams as required in the Specifications. The installer removed samples at locations selected by Hazen and Sawyer. The geomembrane seams were tested on the basis of at least one destructive sample per 500 linear feet of seam length. For the approximate total of 29,900 linear feet of seaming completed, a total of 60 destructive seam samples were removed for an average of one sample per 490 linear feet of seam length.

The destructive samples removed by Environmental Design & Construction were approximately 48 inches long. Each sample was divided into three nominally equal segments; one for laboratory evaluation, one for installer testing and one for archive. Archive samples will be retained by the County.

Destructive seam testing was conducted by AGP Labs under contract with Hazen and Sawyer. Both seams of the double hot wedge fusion seams and extrusion welds were tested in peel in accordance with ASTM D413 (as modified in NSF Standard 54). Both fusion and extrusion seams were also tested for Bonded Shear Strength in accordance with ASTM D3083 (as modified in NSF 54).

The qualifying criteria for destructive seam evaluations are listed below:

- Peel Adhesion
    1. Film Tearing Bond (FTB)-type Failures on 4 of the 5 specimens, and

2. A minimum load at yield of 72 lb/in width.

- Bonded Shear Strength
  1. FTB-type failures on all specimens, and
  2. A minimum load at yield of 108 lb/in. width.

Of the 60 samples tested, a total of one sample (DS 21) was disqualified on the basis of the criteria listed above. The affected seams were cap stripped by Environmental Design and Construction. Cap strips were then nondestructively tested by the installer.

All destructive seam samples passed the testing criteria or were cap stripped prior to approval of the installation.

A summary of the destructive seam evaluation program, along with Destructive Seam Sample Reports, and laboratory test data are provided in Appendix 3.9.

ATTN: Mr. Stacey Smith
4000 Westchase Blvd., Ste. 550
Raleigh, NC 27607

RE: Client Job - Halifax NC; No. 3716
AGP Project No. HS1530.005

Dear Mr. Smith:

Two (2) samples were received for testing. The samples were identified as follows:

SAMPLE I.D.	AGP COMMENTS
Roll No. 1249	60 MIL GMS
Roll No. 1238	60 MIL GMS

The samples were tested in accordance with the test methods listed below and industry accepted modifications (National Sanitation Foundation Standard 54, Appendix A) of those methods:

1) ASTM D 1505, "Test Method for Density Of Plastics By The Density-Gradient Technique"

2) ASTM D 1603, "Test Method for Carbon Black in Olefin Plastics"

3) ASTM D 638 (As modified by NSF 54, Appendix A), "Test Method for Tensile Properties Of Plastics"

4) ASTM D 1004, "Test Method for Initial Tear Resistance Of Plastic Film And Sheeting"

RESULTS:

TENSILE /ELONGATION
ASTM D 638 NSF MODIFIED

Testing Speed (ipm) = 2

Grip Separation (in) = 2.5
Gauge Length (in) = 2.0

Samples were submitted by HAZEN & SAWYER. AGP Laboratories, Inc. has no specific knowledge as to conditioning, origin, or sampling procedure prior to arrival of the samples at AGP. The testing listed herein is based upon accepted industry practice as well as by the test method listed. AGP Laboratories neither accepts nor makes claim as to final use and purpose of the material. This report only relays test methods and associated values. It does not comment on compliance of materials with specifications.

If there are any questions please contact us.

Respectfully yours,

RE: Client Job - Halifax NC
AGP Project No. HS1530.001

Dear Mr. Smith:

Three (3) samples were received for testing. The samples were identified as follows:

SAMPLE I.D.	AGP COMMENTS
N9-6-93-1547-4	GMS
N9-6-93-1580-4	GMS
N9-6-93-1600-4	GMS

The samples were tested in accordance with the test methods listed below and industry accepted modifications (National Sanitation Foundation Standard 54, Appendix A) of those methods:

1) ASTM D 751, "Test Method for Coated Fabrics"

2) ASTM D 1505, "Test Method for Density Of Plastics By The Density-Gradient Technique"

3) ASTM D 1603, "Test Method for Carbon Black in Olefin Plastics"

4) ASTM D 638 (As modified by NSF 54, Appendix A), "Test Method for Tensile Properties Of Plastics"

5) ASTM D 1004, "Test Method for Initial Tear Resistance Of Plastic Film And Sheeting"

RESULTS:

TENSILE /ELONGATION
ASTM D 638 NSF MODIFIED

Testing Speed (ipm) = 2 **Grip Separation (in) = 2.5**
Gauge Length (in) = 2.0

	TENSILE (PPI)				ELONGATION (%)			
	Yield		Break		Yield		Break

APPENDIX 3.5
SUBGRADE APPROVAL FORMS

GEOMEMBRANE INSTALLATION
SUBGRADE CERTIFICATION

Project: HALIFAX CO. COAL ASH MONOFILL - CELL 1

Location: HALIFAX COUNTY, NORTH CAROLINA

Date: 11-2-93 **Time:** 10:30 a.m.

Reference Sketch: # 1

This document certifies that the subgrade as described above is acceptable for geomembrane installation.

The surface is smooth and free of all potentially damaging rocks, stones, sticks, roots, sharp objects or debris. The surface provides a firm foundation for the geomembrane as outlined in the Project Specifications. No standing water or excessive moisture exists on the subgrade.

The parties below approve the subgrade for geomembrane installation on the aforementioned date.

Any changes in subgrade condition caused by weather conditions, vehicle traffic, etc., will require re-approval of affected areas.

GEOMEMBRANE INSTALLATION
SUBGRADE CERTIFICATION

Project: HALIFAX CO. COAL ASH MONOFILL - CELL 1

Location: HALIFAX COUNTY, NORTH CAROLINA

Date: 11-23-93 **Time:** 8:15 AM

Reference Sketch: #5

This document certifies that the subgrade as described above is acceptable for geomembrane installation.

The surface is smooth and free of all potentially damaging rocks, stones, sticks, roots, sharp objects or debris. The surface provides a firm foundation for the geomembrane as outlined in the Project Specifications. No standing water or excessive moisture exists on the subgrade.

The parties below approve the subgrade for geomembrane installation on the aforementioned date.

Any changes in subgrade condition caused by weather conditions, vehicle traffic, etc., will require re-approval of affected areas.

	Name	Position

RE: Client Job - Halifax NC
AGP Project No. HS1530.002

Dear Mr. Smith:

Five (5) samples were received for testing. The samples were identified as follows:

SAMPLE I.D.	SEAM	NOMINAL THICKNESS	AGP COMMENTS
DS-1	5/6	N/A	GMS/DHW
DS-2	24/25	N/A	GMS/DHW
DS-6	85/86	N/A	GMS/DHW
DS-7	87/88	N/A	GMS/DHW
DS-8	88/89	N/A	GMS/DHW

The samples were tested in accordance with the test methods listed below and industry accepted modifications (National Sanitation Foundation Standard 54, Appendix A) of those methods:

1) ASTM D 4437 (As modified by NSF Standard 54, Appendix A), "Practice for Determining the Integrity of Field Seams Used in Joining Flexible Polymeric Sheet Geomembranes"

RESULTS:

Sample (Thickness, mil)	Specimen Number	PEEL ADHESION Lbs/in	PEEL ADHESION Type Failure	SHEAR Lbs/in	SHEAR Type Failure
DS-1	1	136	FTB/SE-1	164	FTB/BRK
	2	113	"	166	FTB/SE-1
	3	122	"	167	FTB/BRK
	4	126	"	162	FTB/SE-1
	5	125	"	163	"
	AVG	124		164	
DS-2	1	118	FTB/SE-1	167	FTB/SE-1
	2	131	"	166	"
	3	120	"	161	"
	4	107	"	165	"
	5	85	NON-FTB/AD (100%)	164	"
	AVG	112		165	
DS-6	1	119	FTB/SE-1	169	FTB/SE-1
	2	109	"	165	"
	3	111	"	165	"
	4	118	"	162	"
	5	114	"	169	"
	AVG	114		166	
DS-7	1	113	FTB/SE-1	173	FTB/BRK
	2	112	"	167	FTB/SE-1
	3	130	"	172	"
	4	109	"	167	"
	5	113	"	169	"
	AVG	115		170	
DS-8	1	105	FTB/SE-1	170	FTB/SE-1
	2	104	"	168	"
	3	110	"	170	"
	4	105	"	169	"
	5	111	"	172	"
	AVG	107		170	

Samples were submitted by HAZEN & SAWYER. AGP Laboratories, Inc. has no specific knowledge as to conditioning, origin, or sampling procedure prior to arrival of the samples at AGP. The testing listed herein is based upon accepted industry practice as well as by the test method listed. AGP Laboratories neither accepts nor makes claim as to final use and purpose of the material. This report only relays test methods and associated values. It does not comment on compliance of materials with specifications.

If there are any questions please contact us.

Respectfully yours,

Wayne Youngblood

RE: Client Job - Halifax NC; No. 3716
AGP Project No. HS1530.007

Dear Mr. Smith:

Seventeen (17) samples were received for testing. The samples were identified as follows:

SAMPLE I.D.	SEAM	NOMINAL THICKNESS	AGP COMMENTS
DS-13		N/A	GMS/DHW
DS-16		N/A	GMS/DHW
DS-17		N/A	GMS/DHW
DS-18		N/A	GMS/DHW
DS-19		N/A	GMS/DHW
DS-21		N/A	GMS/DHW
DS-24		N/A	GMS/DHW
DS-25		N/A	GMS/DHW
DS-28		N/A	GMS/DHW
DS-29		N/A	GMS/DHW
DS-39		N/A	GMS/DHW
DS-42		N/A	GMS/DHW
DS-53		N/A	GMS/DHW
DS-54		N/A	GMS/DHW
DS-55		N/A	GMS/DHW
DS-56		N/A	GMS/DHW
DS-58		N/A	GMS/DHW

The samples were tested in accordance with the test method listed below and industry accepted modifications (National Sanitation Foundation Standard 54, Appendix A) of that method:

1) ASTM D 4437 (As modified by NSF Standard 54, Appendix A), "Practice for Determining the Integrity of Field Seams Used in Joining Flexible Polymeric Sheet Geomembranes"

RESULTS:

SECTION 4
INTERNAL STORMWATER COLLECTION SYSTEM

4.0 INTERNAL STORMWATER COLLECTION SYSTEM

Precipitation that lands within Cell 1 and potentially contacts the coal residue, called contact water, is treated both within the cell and in an exterior basin to remove sediment. The basin, referred to as the Internal Stormwater System Settling Basin, is shown on Drawing G5, Section 7 of this report. It is located to the south of the cell footprint. The basin was constructed using Compacted Embankment, (see Section 2 of this report) to the lines and grades shown on Drawing G6. A typical section through the basin showing the riser and barrel assembly is provided on Drawing G18, Section 7.

Inside the cell, internal stormwater is conducted to the 30-inch diameter prefabricated HDPE sump located in the center of the south perimeter berm. The sump was fabricated by Fife Pipe, Inc. Hazen and Sawyer reviewed shop drawings and field verified dimensions of the sump. The as-built sump drawings are provided on Drawing G5, Section 7. The HDPE geomembrane was extrusion welded to the sump flange.

Two additional prefabricated HDPE risers are connected to the sump by 18-inch diameter solid HDPE pipes. The risers were surrounded by No. 57 stone. A detail showing the riser is shown on Drawing G9.

Geonet and overlying Cushion Geotextile were installed in the sump area prior to placement of overlying No. 57 stone and Operational Cover. See Drawing G8, Section 7 of this report.

The Cell 1 sump and the internal stormwater basin were connected by a 12-inch diameter HDPE gravity line. Sumps for future Cells 2 and 3 were installed during Cell 1 construction to eliminate service interruption during

tie-in of future cells. A typical detail for Sumps 2 and 3 is shown on Drawing G8, Section 7.

All HDPE pipe was Phillips Driscopipe 1000 in accordance with project Specifications. The 12-inch diameter pipe for the gravity line was SDR 17, and the 18-inch internal pipes were SDR 32.5.

Pipe connections were field butt-fusion welded by Fife Pipe, except where bolted flanges are shown on the Record Drawings.

Each of the prefabricated sumps were pressure tested separately prior to installation. The gravity line was pressure tested by Barnhill after all connections were made and a temporary end plug was installed. To perform the test, water was pumped into Sump 1 until it remained full. The tops of Sumps 2 and 3 were temporarily sealed. The pipe joints and sumps were visually inspected by Hazen and Sawyer and Barnhill. No leaks in permanent joints were observed during the 1 hour test period.

Once testing was completed, cement/bentonite grout was pumped beneath and around the sumps as shown on Drawing G8. Once the grout was allowed to set, the pipe was backfilled with Compacted Embankment to the original ground surface. A concrete cover was placed on Sumps 2 and 3.

Pipe data and sump shop drawings are presented in Appendix 4.1.

Raleigh, NC 27607

Dear Stacey:

Enclosed are the revised shop drawings for the Halifax County Landfill project. The 12" HDPE flanges have been deleted from the sumps. On sump #1 I have added a fuse on end cap. Also, the stubouts have been extended to accomodate the jaws of the fusion machine. These changes will make the line jointless and greatly reduce the risk of leakage.

Concerning the testing of the line, I submitted drawings and a testing plan to Barnhill Construction. They should be submitting this to you soon. This plan incudes another fuse on cap to be joined to the pipe at the sediment basin to seal off the system. This cap can then be cut off at the end of the test.

If you have any further questions, feel free to give me a call.

Sincerely,

Edwin Douglas

MEMORANDUM

Subject: High Density Polyethylene Pipe Submittals

Project: Halifax County Landfill

Contractor: Barnhill Contracting Co.

Pipe Supplier: FIFE Industrial Pipe Co.
by Mark R. Wallbom, V.P. Mark R. Wallbom

Pipe Manufacturer: Phillips Driscopipe, Inc.

This memorandum is intended to serve as certification that the high density polyethylene pipe and fittings meet the specifications for the above referenced job. The materials being provided are made from the TR 480 resin and known as Driscopipe 1000. FIFE Pipe is an authorized representative of Phillips Driscopipe.

The pipe meets all requirements of ASTM F714 and is made from a high density, high molecular weight polyethylene pipe material meeting the requirements of Type III, Class C, Category 5, Grade P 34, as defined in ASTM D 1248. The pipe will be made from a polyethylene compound having a cell classification of 345434C as referenced in ASTM D 3350. The fittings will be made from the same material.

Phillips Driscopipe will provide the contractor with certification that the pipe being supplied for this job meets all of the aforementioned specifications. The 12" and 18" pipe called for on the project will be SDR 17 and 32.5 respectively. In the case of the fittings, they will either be molded, having an SDR of 17, or will be fabricated from an SDR which will be at least one lower to allow for de-rating of the fitting to match the pressure rating of the pipe.

The following attachments and catalog cuts are made part of this submittal by reference:

* Driscopipe 1000 Brochure
* Typical Physical Properties of Driscopipe 1000
* Driscopipe Piping Systems Brochure
* Driscopipe Fittings "Sizes and Dimensions"
* FIFE Pipe Brochure on fabrication capabilities

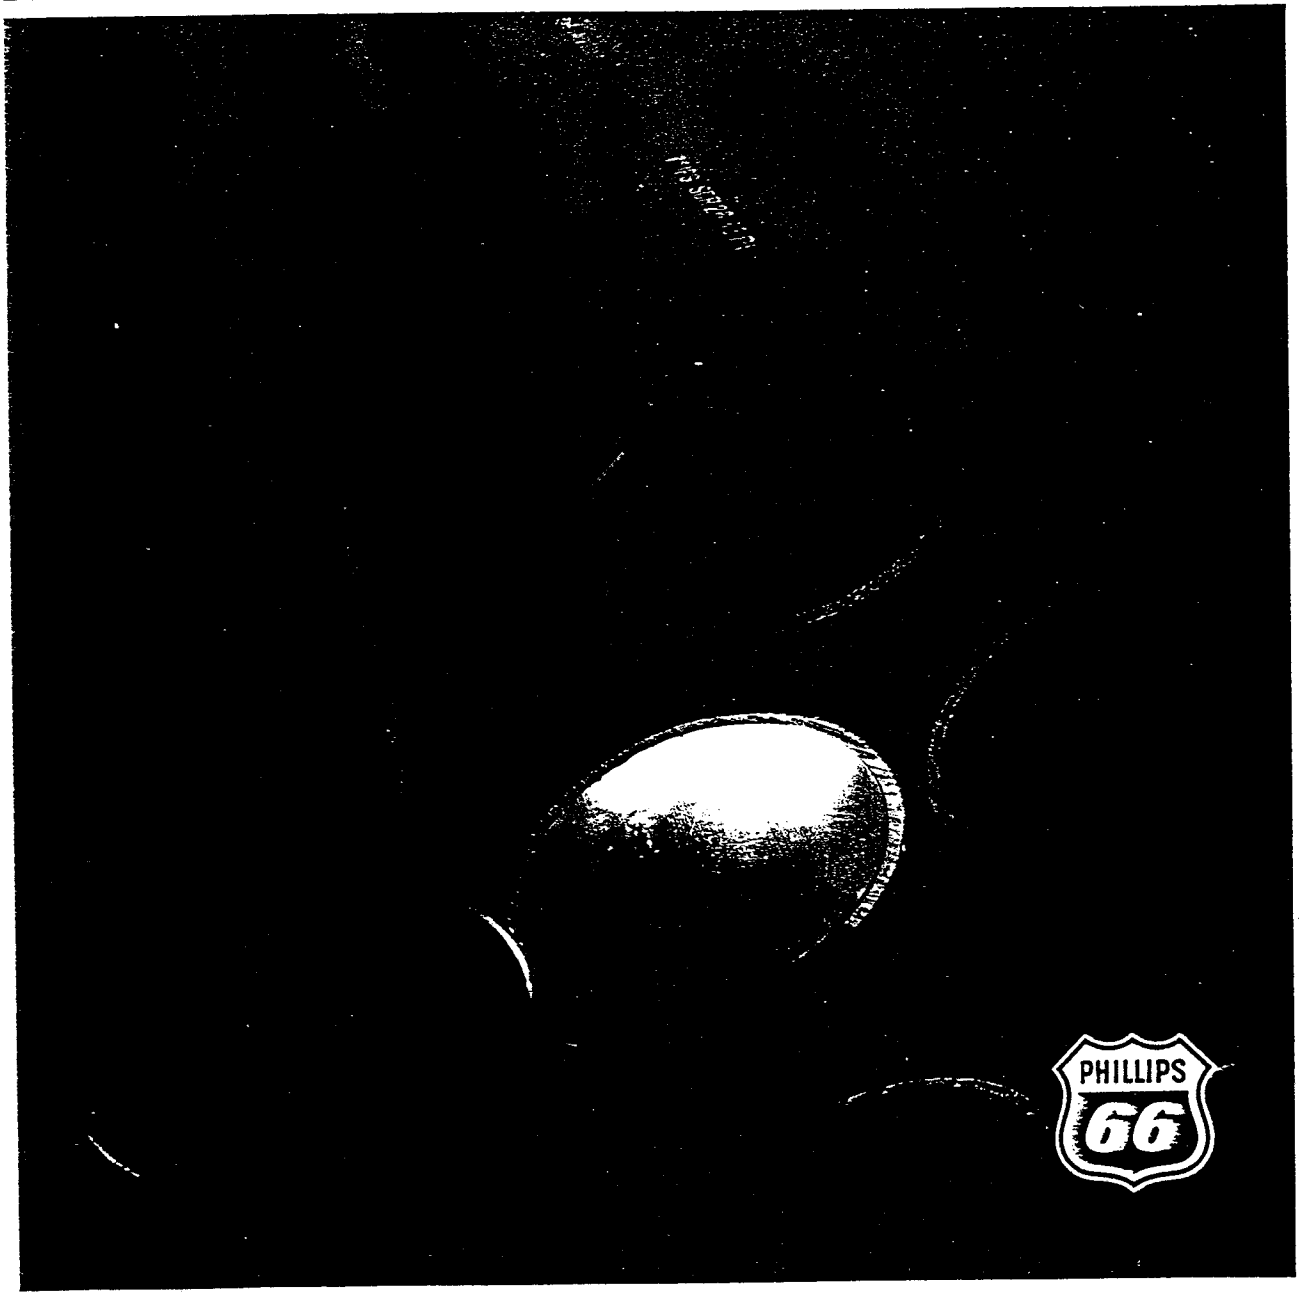
Driscopipe 1000

High Density Polyethylene Pipe For Industrial And Municipal Applications



DRISCOPIPE

Driscopipe® 1000 series

Data Sheet

Customer Benefits

High quality Driscopipe® 1000 is manufactured from extra high molecular weight, high density PE3408 polyethylene pipe grade resin.

This black, weather-resistant pipe exhibits . . . .

- Outstanding Chemical & Corrosion Resistance
- High Environmental Stress Cracking Resistance
- Improved Flow Characteristics
- Toughness & Ductility
- Flexibility with lightweight
- Non-Toxic
- Abrasion Endurance
- Fatigue Endurance
- Long-term Hydrostatic Strength / Physical strength
- Reliability

Suggested Industries & Applications

- Industrial Water Distribution
- Agriculture
- Landfills
- Marine
- Pollution Control
- Pulp / paper / wood
- Power Plants
- Petrochemical
- Mining / Mineral Processing
- Dredging / sand / gravel
- Organic Chemicals
- Inorganic Chemicals
- Aquaculture
- Hazardous Waste
- Local / State / Federal Gov'ts.
- Cement Plants
- Irrigation
- Municipal
- Gravity sewers
- Forced main sewers
- Water distribution
- Sewer treatment
- Sludge handling
- Leachate collection
- Dual Containment
- Brine
- Fertilizer
- Acid / Caustic lines
- Utility / Process piping
- Slurry
- SX acid mining
- Tailings disposal
- Marinas
- Snow melting / making
- Hard rock mining
- Coal Slurry / Processing
- Dredging
- Water intakes
- Water outfalls
- Fire-water
- De-Watering
- Fly-Ash disposal
- Temporary pipelines
- Cable Stayed Bridges
- Golf course irrigation
- Farmland irrigation
- Swimming pools
- Ice rinks
- . . . . and many others

Available in sizes 1" thru 54"

Specification Data

UNIFORM STRAIGHT BILL OF LADING OR DELIVERY RECEIPT of Lading, nor a copy or duplicate and is intended solely for filling or record.

6

IF OR WHEN THIS INSTRUMENT CONSTITUTES A BILL OF LADING, the Carrier, on shipping date shown below, has received, subject to the classifications and tariffs in effect on such date, the property described below, in apparent good order, except as noted (contents and condition of contents of packages unknown), marked, consigned, and destined as indicated below, which said carrier (the word carrier being understood throughout this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery at said destination, if on its route, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed, as to each carrier of all or any of said property over all of any portion of said route to destination, and as to each party at any time interested in all or any of said property, that every service to be performed hereunder shall be subject to all the terms and conditions of the Uniform Domestic Straight Bill of Lading set forth (1) in Uniform Freight Classification in effect on the date hereof, if this is a rail, or a rail-water shipment, or (2) in the applicable motor carrier classification or tariff if this is a motor shipment.

Shipper hereby certifies that he is familiar with all the terms and conditions of the said bill of lading, including those on the back thereof, set forth in the classification or tariff which governs the transportation of this shipment, and the said terms and conditions are hereby agreed to by the shipper and accepted for himself and his assigns.

☐ BILL OF LADING
☐ PRODUCT DELIVERY RECEIPT

(This instrument is not a bill of lading when the property described below is moved in a vehicle (other than that of a common carrier) furnished and/or operated by the shipper or owner of the property, but is merely a receipt for said property on behalf of shipper or owner.)

SECTION 5
OPERATIONAL COVER

5.0 OPERATIONAL COVER

Operational Cover placement began on the North perimeter berm at the cell entrance. A section of Cushion Geotextile was first placed on the cell sideslope in the ramp area. Soil was pushed by a Caterpillar D6 dozer over the crest of the slope to construct a working pad. The dozer worked its way into the cell until the working pad was large enough for a Caterpillar 615 scraper to drive onto the pad and turn around. The pad was then pushed eastward along the North perimeter berm until it sloped into a three foot thick road approximately 40 feet wide.

Placement of Operational Cover on the base of the cell began on December 8, 1993. It began at the base of the access ramp and proceeded to the east across the toe of the Northern perimeter berm slope. The Operational Cover soils were recovered from Stockpile "B" located adjacent to the North perimeter berm, as shown on Drawing G5, Section 7. Soils from this stockpile consisted of cohesive clayey silts. A representative of Geotechnologies, Inc. visually examined the soil for any unsuitable materials such as roots, rocks, and other deleterious objects. All unsuitable materials were removed and placed outside the cell area. During the placement of the Operational Cover, laborers worked with each dozer to identify and work out liner wrinkles to prevent creases from folding over.

An initial three foot lift was placed over the geomembrane and a Caterpillar D6 dozer and Caterpillar 615 scraper were used to place soil. The cover was then "fingered" across the cell in a North - South direction in a three foot lift. Once a substantial amount of soil was placed in the cell, a Caterpillar D4 Low Ground Pressure (LGP $<$ 6psi) dozer was used to push the cover across the cell in a one foot lift. The Operational Cover was placed in only the bottom one foot of the cell due to 2H:1V sideslopes of the perimeter berms. Operations were constantly monitored to assure that

only the LGP dozers were allowed to operate on the one foot thick layer of Operational Cover. Any type of equipment not classified as LGP was not allowed on Operational Cover less than three foot in thickness.

As the LGP dozers spread the one foot lift, a 25′ wide access road and tipping area were constructed along the North perimeter berm, as shown on Drawing G5. The tipping area was made as a turnaround approximately 100′ in diameter to allow hauling vehicles easy access into and out of the cell. The access road includes an 8" lift of ABC stone on top of a Separator Geotextile. In addition, the LGP dozers fine graded the Operational cover to prevent accumulation of runoff.

The surface of the Operational Cover was tracked in with the LGP dozers. Hazen and Sawyer and Geotechnologies, Inc. monitored the placement of the Operational Cover material to observe any signs of damage to the geomembrane. During placement, a section of the liner east of the access ramp was punctured by the dozer blade on the North slope. Landsavers, Inc., a subcontractor of Barnhill Contracting, patched the area. A Hazen and Sawyer representative was on site to observe the patching process to assure that it was done in accordance with the project specifications.

SECTION 6
MONITORING WELLS

6.0 WATER QUALITY MONITORING

A total of seven monitoring wells were installed for water quality monitoring for Cell 1. Two wells, MW13 and MW14 are temporary wells which will be abandoned during construction of Cell 2. In addition to the monitoring wells, two stream locations and the Internal Stormwater System Settling Basin were sampled on January 20, 1994 by Environment One, Inc., under contract with the County in accordance with the Construction permit.

The Water Quality Monitoring Plan and the report describing well construction, including well construction diagrams, were prepared by Armstrong Geological and Engineering Services. Their report is provided in Appendix 6.1. Coordinates and ground surface elevations for each monitoring well location are provided on Drawing G5, Section 7.

January 20, 1994

Mr. John Bove
Hazen and Sawyer
4011 Westchase Boulevard
Suite 500
Raleigh, NC 27607

Dear Mr. Bove:

Samples were collected on the above date at the Halifax County Coal Ash Landfill. Seven (7) monitoring wells, two (2) surface water locations, one (1) basin location, and one (1) off-site drinking water well were sampled. Total Suspended Residue, total metals, and dissolved metals will be analyzed on all locations, except for the drinking water location, along with all other requested parameters. The drinking water location will be analyzed for total metals and TOX only.

If you have any questions please give me a call.

Sincerely,

Steve Jones

cc: Jerry Williams

SECTION 6.1
WELL COMPLETION RECORDS

January 20, 1994

Division of Solid Waste Management
Department of Environment, health, and Natural Resources
401 Oberlin Road
Post Office Box 27687
Raleigh, North Carolina 27611-7687

Reference: Well Construction Logs / Well Completion Records
Halifax County Ash Monofill
Halifax County, North Carolina

Dear Mr. Lutfy:

Enclosed are well construction logs and well completion records for the new ground water monitoring wells constructed for the Halifax County Ash Monofill. These monitoring wells, MW-9, MW-10, MW-11, MW-12, MW-13, and MW-14, as shown on the attached Hazen and Sawyer figure, were constructed under the supervision of a North Carolina Registered Geologist. A ground water monitoring plan is being provided separately and the first sampling round is scheduled for January 20, 1994. The previously existing monitoring well MW-8, which is also part of the monitoring well system for the landfill, is also scheduled to be sampled during the first sampling round.

Please contact us or Hazen and Sawyer if you have any questions.

Sincerely,

Macklin M. Armstrong

Macklin M. Armstrong, P.G.
Principal Geologist

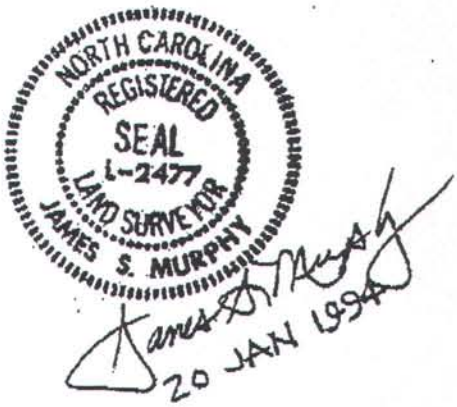
Traverse closure: Angles exceed class "AA", 1/26,552 precision.

All elevations from closed loops from referenced benchmarks.

MW01 was not in original scope. Well was locked and no H&S personnel were on site when this well was surveyed.

CASE OPEN: This represents the top of the outer protective casing when the well is opened and the cover is hinged away.

RISER: Inner wells were capped and locked. These elevations are on top of protective PVC cap.



SECTION 6.2
GROUNDWATER MONITORING PLAN

SOLID WASTE SECTION
FEB - 8 1994

GROUND WATER MONITORING PLAN
HALIFAX COUNTY ASH MONOFILL
HALIFAX COUNTY, NORTH CAROLINA

As part of the Coal Ash Monofill Permit Application for the Halifax County Solid Waste Department, the following ground water and surface water monitoring plan is proposed for the landfill in accordance with 15A NCAC 13B rules in order to monitor the effects of the facility on the surrounding and underlying water. The plan shall consist of semi-annual testing of ground water monitoring wells and surface water sampling in adjacent waterways.

The ground water monitoring system consists of five permanent monitoring wells, MW-8, MW-9, MW-10, MW-11, MW-12, and two temporary monitoring wells, MW-13 and MW-14. Monitoring well MW-12 will serve as the upgradient background well and the other wells will serve as dowgradient wells. The locations of the monitoring wells are shown in the Hazen and Sawyer figure (Figure 1) attached to this plan. Screen depths for the wells are summarized in Table 1. All monitoring wells were constructed in accordance with 15 NCAC 2C Section .0100. The wells were constructed such that a water sample can be obtained at each monitoring well location throughout the year. All monitoring wells are protected from impact by mechanized equipment by a protective steel casing. The locations and depths of the monitoring wells are such to allow early detection of ground water contaminants within the upper most aquifer(s) in the principle down gradient directions.

The surface water monitoring system is designed to monitor any contaminants entering the stream to the south of the ash landfill. One upstream monitoring point, SW-C1, and one downstream monitoring point, SW-C3, will be established along the stream as shown on the attached figure. In addition, outfall at the internal stormwater basin, SW-C2, will be tested during the initial sampling round.

Testing methods will be in accordance with accepted industrial protocol and North Carolina Solid Waste Section (SWS) rules and policy. For baseline sampling, ground water testing shall be conducted for the parameters set forth in "North Carolina Water Quality Monitoring Guidance Document for Solid Waste Facilities," prescribed by NC-DSWM, and SWS rules and policies. After the first baseline sampling round, the parameters BOD, COD, TOX, TOC, iron, and manganese will not be tested. Unfiltered samples will be collected in the field for total metals analysis. Total suspended solids (TSS) will also be tested during all sampling rounds.

In accordance with 15A NCAC 13B Rule .1623 (b) (3) (c), this monitoring plan has been prepared under the responsible charge of a duly Licensed Geologist, authorized to practice under North Carolina General Statute 89E. This plan should be reasonably effective in providing early detection of a release of a hazardous constituent(s) from the ash landfill into the upper most aquifer(s), which would constitute a risk to public health and the environment.
