Mr. Jim Barber
Eastern Area Engineer
Solid Waste Section

Subject: Warren County Solid Waste
Transfer Facility Permit Renewal

Dear Mr. Barber:

The Warren County Solid Waste Department is requesting the renewal of its Transfer Facility Operation Permit.

The Facility will continue to be maintained and operated in accordance with the approved Operational Plan already on file and in accordance with rule 15A NCAC 13B .402, "Operational Requirements for Transfer Facilities."

The service area will be the County of Warren along with the Towns of Norlina, Macon and Warrenton.

Waste Industries Inc. is the current contractor in charge of the transfer station daily operations. Brunswick Landfill located in Virginia and Upper Piedmont Regional Landfill located in North Carolina receives the final disposal of waste from the station.

If you have any questions, please contact me at (252) 257-1538.

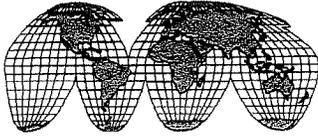

Sincerely,

Marshall Brothers

Marshall Brothers,
Solid Waste Director

(1) – Operation

The transfer station consist of a standby tipping floor and an adjacent tipping area where collection trucks discharge the waste into a chute to a compactor. Town, County, waste haulers, collection vehicles and private vehicles discharge solid waste into the chute. In the event of failure or maintenance of the compactor, the waste is placed on the standby tipping floor. The transfer trailer is located adjacent and below the tipping floor. The total tractor-trailer weight is recorded at the existing full length scales before leaving the facility. The Operator utilize walking floor transfers to haul the average 30 tons of waste per day it currently receives.

The transfer station continue to operated in accordance with the approved Operations Plan and all Conditions of Permit specified in the DSWM’s Transfer Facility Permit. No specific groundwater monitoring is required under Section .0400 – Transfer Facilities of the NC Solid Waste Management Rules. Records are kept of weights discharged at the transfer station.

During operation, dumped waste is deposited into the chute to the compactor which charge a waiting haul truck. The facility is swept and washed down at the end of operations each day. Grates and traps at drains are cleaned of solids before wash down and Solid waste collected is disposed of properly. The wastewater pretreatment works on-site is inspected on a regular basis, the following items are checked and cleaned as needed.

- (1). Inspect Grit Collector, remove accumulated grit and dispose of properly in container for combining with waste to be hauled to the landfill.
- (2). Inspect Oil/Water Separator, remove accumulated oil when level is deep enough to enable removal and then dispose of properly.
- (3). Inspect Pump Station operation.

(2) – Receivable Waste

The transfer station receives (municipal solid waste and commerical waste) and average 25-30 tons a day. The station does not accept hazardous or liquid waste, asbestos, or other waste not accepted at the final disposal facility unless a separate waste determination is made and applied for. The transfer station receives only the waste it is permitted to receive and does not receive any waste that is prohibited at the final disposal site (landfill). For “special wastes” considered for acceptance and not specifically identified in the approved Operations Plan, permission for acceptance will be sought from the DSWM. An amendment to the Permit or a waste determination will be sought should conditions warrant.

Do not accept barrels and drums unless they are empty and sufficiently perforated to ensure that no liquid or hazardous waste is contained therein.

(3) – Wastewater Disposal

Runoff and wash water from the tipping floor and loading area is collected and piped to on-site pretreatment works, consisting of a grit collector, oil/water separator and a pump station. Wastewater is pumped to the Town of Warrenton’s municipal wastewater treatment plant. The runoff generated from daily washing of the station and from rainwater does not exceed an average of 1200 gallons per day. Site runoff is diverted away from the tipping area.

(4) – Fire Control

Fire fighting services is provided by the Town of Warrenton or the Warrenton Rural Fire Department. The transfer station is also equipped with a fire extinguisher for control of small fires.

In case of a fire, The Town of Warrenton is immediately contacted. All personnel at the facility are familiar with the use of the fire extinguish on-site. Inspect, service and operate fire extinguishers in accordance with manufacturer's instructions. All fires are reported to the NC Division of Solid Waste Management within 24 hours and written notification is provided within 15 days. Telephone numbers are included under contacts.

(5) – Vector Control

The station is swept and washed down and free of solid waste at the end of each day. Full or partially filled haul trailer are left at the Transfer Station overnight but are covered or closed.

The tipping floor is thoroughly swept and washed-down at the end of operation each day or as warranted. Any wastes that have an increased potential for attracting flies, rodents, and other insects or vermin is disposed of in the transfer trailer as soon as possible. Under normal operating conditions the station is free of uncontained solid waste at the end of each day. Solid waste is not stored on the tipping floor over-night.

(6) – Equipment

The transfer station utilizes the following equipment for regular operation and maintenance:

- Compactor/chute to load transfer trailers.
- Rubber-tired front end loading of tipped wastes from standby tipping floor.
- Transfer Trailers
- Scales for weighing incoming and transferred waste.

(7) – Control of Wind Blown Waste

The tipping floor and loading areas are provided with fence to mitigate windblown debris. Under normal operation collection vehicles tip their waste directly to the compactor chute thereby mitigating the potential for windblown waste. All tipped waste is contained in the immediate area and cleaned up at the end of each working day.

All waste that escapes the area is collected as soon as possible and disposed of properly.
